Contents

1	Background and definitions	1
1.1	A new register	1
1.1.1	Type of diabetes	2
1.1.2	Gestational Diabetes (GDM)	3
1.1.3	PolyCystic Ovarian Syndrome (PCOS)	3
1.1.4	Summary	3
2	DMreg and other files in R-format	4
2.1	The diabetes register	4
2.2	Population file	4
2.3	The migration file	5
2.4	The population Lexis object	5
2.5	Status file	5
2.6	Complication files	5
2.7	Prescription register files	6
2.8	LABKA files	6
3	Documentation of the conversion to R-format	7
3.1	SAS-version of DMreg converted to R	7
3.1.1	The administrative diabetes register	8
3.1.2	The epidemiological diabetes register	10
3.1.3	The diabetes drug register	10
	Comparison of DMreg and DMdreg	12
3.2	The population files	12
3.2.1	The migration file	17
3.3	The status file	17
3.3.1	Converting the SAS dataset to .Rda format	18
3.3.2	Creating income deciles	20
3.3.3	Saving the file for future use	20
3.4	The population Lexis object	21
3.4.1	Reading migration data	23
3.4.2	Carving out the emigrated time	23
3.4.3	Reading population data	27
3.4.4	Adding diabetes status	27
3.4.5	The population by diabetes status, corrected for migration pattern	28
3.4.6	Comparison with the raw DMreg	29
3.5	Follow-up by sex, age and calendar time	31

3.5.1	Tabulation for international consortium	34
3.6	The complications files	40
3.6.1	The SAS programs generating the complications files	41
3.6.2	Converting SAS datasets to <code>.Rda</code> format	41
	Complication grouping	42
	Complication names	45
	Number of recurrent events per person	46
	Grooming the data frames	47
3.6.3	Microvascular complications	48
3.6.4	Using the complications data sets	52
3.7	The RMPS database	54
3.7.1	The ATC codes with names	54
3.7.2	Converting to <code>.Rda</code>	54
3.7.3	Retrieving the data for each ATC group	59
3.8	The LABKA database	60
3.8.1	SAS splitting of the LABKA data.	60
3.8.2	Converting to <code>.Rda</code>	60
4	SAS programs	64
4.1	Rationale and overview	64
4.2	Program execution	66
4.3	Program documentation	67
4.3.1	<code>optslibs.sas</code>	67
4.3.2	<code>xgdm.sas</code>	68
4.4	00-base	68
4.4.1	<code>00-base.lst</code>	71
4.5	00d-base	79
4.5.1	<code>00d-base.lst</code>	82
4.6	00y-base	150
4.6.1	<code>00y-base.lst</code>	185
4.7	01-npr	188
4.7.1	<code>01-npr.lst</code>	201
4.8	02-dvdd	211
4.8.1	<code>02-dvdd.lst</code>	215
4.9	03-nhsr	219
4.9.1	<code>03-nhsr.lst</code>	222
4.10	04-rmps	224
4.10.1	<code>04-rmps.lst</code>	231
4.11	05-diab	233
4.11.1	<code>05-diab.lst</code>	235
4.12	05-hba1c	237
4.12.1	<code>05-hba1c.lst</code>	243
4.13	06-define	246
4.13.1	<code>06-define.lst</code>	250
4.14	06d-define	255
4.14.1	<code>06d-define.lst</code>	257
4.15	10-labcomp	259

4.15.1	10-labcomp.lst	268
4.16	10-compl	271
4.16.1	10-compl.lst	281
4.17	00-labka	291
4.17.1	00-labka.lst	297
4.18	00-rmps	306
4.18.1	00-rmps.lst	312
4.19	00-fmts	321

Chapter 1

Background and definitions

The maintenance of the National Diabetes Register (NDR) was discontinued by the Health Data Authority (Sundhedsdatastyrelsen) after 2012. It has been replaced by the Register of Selected Chronic Diseases (RUKS — Register for Udvalgte Kroniske Sygdomme) which however does not encompass precisely the same persons. As was the NDR, RUKS is based only on the National Patient register (NPR) and the Register for Medicinal Products Statistics (RMPS) (Lægemiddelstatistikregisteret or in colloquial terms, the Prescription Register).

1.1 A new register

The following is an attempt to construct a national Danish diabetes register, with a special view to define type of diabetes, where we not only distinguish type 1 (T1) and type 2 (T2) diabetes but also include type X (Tx), that is persons classified with “other” types of diabetes.

The first attempt was in 2016, and the current (February 2022) is covering the period of diabetes diagnoses from 1996-1-1 through 2020-12-31, a period of 25 years.

The basic structure of the register is a file with one record per person with person-id, sex, type of diabetes and dates of birth, diagnosis of diabetes and death.

Additionally, there will also be a version of the register will have the dates for meeting each of the defining criteria (name of the date in the register):

doNPR, doNPR2 Dates of the first and second recorded contact date with a diagnosis of diabetes in the NPR.

doOAD, doOAD2 Dates of the first and second recorded purchases of OAD (A10B).

doIns, doIns2 Date of first and second recorded purchases of insulin (A10A).

doDVD Earliest recorded date of diagnosis in the Danish adult diabetes register (DVDD). If no date of diagnosis is in the record, the date of reporting to DVDD is used.

doPod Earliest date of billing for podiatry in the NHR.

doDia First recorded date of eye-screening in the Danish eye-screening database for diabetes patients.

doHbA Date of second consecutive HbA_{1c} greater or equal to 48 mmol/mol, as recorded in the Danish laboratory data base.

As in RUKS we do not include persons based on only one drug purchase or one record in NPR—two of these dates are required for inclusion; and from an epidemiological point of view we make the date of the second of these the criterion date (unlike RUKS that uses the first)..

For the other criteria (DVDD, podiatry, diaBase, HbA_{1c}) we only require one date to include a person—and we use the earliest recorded.

Thus there are ten possible criteria, depending on the sequence of the two earliest dates among records from NPR and RMPS.

1.1.1 Type of diabetes

The classification of patients as T1, T2 or Tx (“other type of diabetes”) based on register data only is not accurate, and the approach chosen here is primarily designed to identify persons with T1 with reasonably high specificity.

Thus T2 and Tx will be equivalent to “cannot be classified as T1D with reasonable certainty”, and hence the classification should be used cautiously. Persons recorded as T1 are most likely to be T1, but there is some under-reporting. So some T1 patients are erroneously classified as T2; the precise size of this problem is unknown, but is likely to be largest in the earlier parts of the register, particularly before the advent of the DVDD in 2006.

We will base the definition of type of diabetes on the most recent recording of type in the registers. This entails a conditioning on the future since we classify persons’ type based on information obtained late in the course. The clinical background for this is that the most recent classification most likely is the most precise.

The practical implementation of the type classification is therefore as follows

- use the DVDD recordings of diabetes type (T1, T2, Other) and classify persons as:
 - T1 if the last record in DVDD classifies the person as T1
 - T2 if the last record in DVDD classifies the person as T2
 - Tx if the last record in DVDD classifies the person as other (“Anden type”)
- if not classified from DVDD, then use the NPR to classify persons as:
 - T1 if the last record in NPR has ICD-8 code 249xx or ICD-10 code E10xx
 - T2 if the last record in NPR has ICD-8 code 250xx or ICD-10 code E11xx
 - Tx if the last record in NPR has ICD-10 code E12xx, E13xxx or E14xx

Note, that before 1994, where the NPR used ICD-8, classification a Tx from NPR does not occur. This is a minor thing, very few persons alive at 1996-1-1 have a last NPR record before 1994-12-31.

- Persons that have purchased insulin before age 30 are always classified as T1, except if classified as T2 or Tx in DVDD.
- Persons without insulin purchase are always reclassified from T1 to T2, but not from Tx
- Any persons not classified by the above are classified as T2.

The reason that we cannot entirely dispose with the NDR in classification of diabetes is that the DVDD was not established till 2005, so the classification of patients dead before 2005 is very sparse in the DVDD.

1.1.2 Gestational Diabetes (GDM)

GDM diagnoses that are less than 200 days from the previous one are disregarded; so from the earliest GDM for a given person, no GDM diagnosis in the next 200 days is counted, from the next after this, another window of 200 days is used etc.

If a person is recorded with a diagnosis of GDM in the NPR, the person cannot enter the register on any criterion during the period from 280 days before till 280 days after the GDM diagnosis.

1.1.3 PolyCystic Ovarian Syndrome (PCOS)

If a person is recorded with PCOS in the NPR, this person cannot be included on the basis of metformin purchase in the period from the earliest PCOS diagnosis until the person's 40th birthday.

Moreover, if a person's only drug dispensations are metformin between age 20 and 40, the person is considered a possible PCOS case and these dispensations are not counted. Dispensation of metformin after age 40 for women with a PCOS diagnosis are considered diabetes medication and lead to inclusion in the register at the first date of purchase after the 40th birthday.

1.1.4 Summary

The register we attempt to build is a register where persons are captured by a set of criteria and then kept in the register with this inclusion date.

Chapter 2

DMreg and other files in R-format

On the DST project 707655 there are files available with the diabetes register, as well as files with various that may be of interest in practical analyses. Most of these contain information from the entire Danish population, not only for diabetes patients.

While the register and accompanying files are constructed using SAS, and the resulting datasets are SAS datasets, most of the analyses will be conducted using R. Therefore the SAS files have been converted to R datasets. In the process all date variables have been converted to class `cal.yr`, that is scaled to years instead of days.

The files (that have extension `.Rda`) are all in the folder: `e:\workdata\707655\DMreg2020\data\`, so when the `xxx` is mentioned it is implicit that we refer to the file `e:\workdata\707655\DMreg2020\data\xxx.Rda`.

Note however, that this section is only a brief overview of the files, when you use them you must first consult the section describing the construction of the `.Rda` files below. Some of the files have special features or shortcomings you need to be aware of

2.1 The diabetes register

The diabetes register you normally use is in the file `DMreg`, but there are three variants of it:

- `DMreg` — the diabetes register with one record per person and only essential variables.
- `DMxreg` — the extended diabetes register with one record per person, but with a number of extra variables relating to the construction of the register included too. Same persons as in `DMreg`
- `DMdreg` — the diabetes drug register; only contains persons with at least two drug purchases recorded in the RMPS. Fewer persons than in `DMreg`

2.2 Population file

The file is called `pop`; it has one record per person in the entire Danish population alive anywhere between 1995-1-1 and 2020-12-31. It contains sex, date of birth, date of death and cause of death.

Note that cause of death is not complete because the coding of cause of death is always lagging about one year relative to other registers.

2.3 The migration file

Persons migrate, but migration status is ignored in the construction of `DMreg`.

We have therefore constructed a file of migration dates; it is a file that has at least one record for each persons that has ever emigrated (left Denmark) or immigrated (entered Denmark). The file contains the variables `pnr`, `doEm` and `doIm`, where `doEm < doIm`.

This means that if a person is first immigrated to Denmark and later emigrated again the person will have two records, the first with a missing value of `doEm` and valid value of `doIm`, and the second record with valid value of `doEm` and a missing value of `doIm`. Thus each record in the file represents a period where the person is *not* in Denmark, hence the name `xDK`.

2.4 The population Lexis object

The file is called `DMfup` (DM follow-up).

We have taken the entire population file and constructed a `Lexis` object of the follow-up from 1995-1-1 through 2020-12-31, with time outside of Denmark removed, and with follow-up classified by diabetes state (`noDM / T1 / T2`).

2.5 Status file

The file is called `popstat`.

This file has one record per person (`pnr`) and year (`yr`). At 1 January each year 1995 through 2020 there is a record for each person in the Danish population alive.

It contains information on the person's status at this date:

- `kommune`: `kom`
- `region`: `reg`
- `education`: `udddk`, `eduen`
- `family income` `find`
- `family income decile` `findec`
- `family id`, `familie_id`
- `children in the family`, `antboernh`

2.6 Complication files

The files are called `wcompl` and `rcmpl`.

There are two complications files; both with dates of complications from the *entire* Danish population:

- `wcompl` — one record per person with at least one of 34 complications recorded. The date of the earliest occurrence of each is given. If the date of a given complication is

missing it means that no complication of the type is recorded in the period 1994-1-1 through 2020-12-31.

The key to the dataset is `pnr`. There are 34 other variables called `doXX`, date of complication `XX`.

- `rcomp1` — one record per recording of each of the complications included (hypoglycemia, `HpoG`; ketoacidosis, `Keto`; myocardial infarction, `MI`; stroke, `Str`)

The key to the dataset is (`pnr`, `comp1`, `doC`) and there are no other variables in the dataset.

2.7 Prescription register files

The Danish name of RMPS is Lægemedelstatistikresisteret (LMS).

The prescription register is very large and only some of the drugs are of interest; we have selected 7 groups of drugs and collected all dispensations of these in 7 separate files. Included in each of the files is a data frame with ACT-codes and corresponding names.

There are 7 files in the folder `e:\workdata\707655\DMreg2020\data\rmps\`, each with the filled prescriptions of a certain group.

2.8 LABKA files

The LABKA database is very large, so in order to facilitate use of it, it has been split in 26 separate files, each with only one type of measurement. The date of measurement, `SAMPLINGDATE` has been converted to `cal.yr`.

There are 26 files, each with a group of measurement types; they are in the folder `e:\workdata\707655\DMreg2020\data\labka\`.

Chapter 3

Documentation of the conversion to R-format

The following sections describe how R data files were created by reading SAS-files and converting to R format. In the process a few extra features are added.

In addition to the diabetes register it is the following files:

- pop (population files),
- stat (status file),
- DMfup (Lexis object of entire population follow up migration-corrected and classified by diabetes status)
- compl (complications files).
- labka (LABKA files),
- rmeps (RMPS (prescription) files),

```
> library(Epi)
> library(tidyverse)
> library(haven)
> setwd("e:/workdata/707655/DMreg/r")
> clear()
> source("../..../util/elapsed.R")
> folder <- "e:/workdata/707655/DMreg2020/data/"
```

3.1 SAS-version of DMreg converted to R

```
> start()
-----
Code: e:/workdata/707655/DMreg/r/mkDMreg.rnw
Time: 2022-01-25 at 14:52:46
-----
```

We have created the DMreg as a SAS-file; the entire process is available in the document <http://bendixcarstensen/DMreg/DMreg2020.pdf>. Also available as `v:\sdc\469drive\DMreg\tex\DMreg2020.pdf`; it should have a creation date earlier than that of this document, but not too much earlier.

In this section we document the conversion of the SAS-version of the register to an R-version with variables defined as factors where necessary, with date variables converted to `cal.yr` and a logical ordering of the variables. There will be two versions, one with only the epidemiologically relevant variables, and one where also the administrative variables involved in defining the register are included. For comparison purposes we also provide a register solely based on drug purchases; this definition is commonly used in many register studies.

3.1.1 The administrative diabetes register

We first read the SAS-version of the register:

```
> system.time(DMxreg <- as.data.frame(read_sas(paste0(folder,
+                                             "DMreg.sas7bdat"))))
  bruger    system forløbet
    9.05      0.21    20.45
```

We want the variable labels for reference so we get the variable labels from the attributes extracted by `read_sas`:

```
> cbind(vlabs <- sapply(DMxreg, FUN = function(x) attr(x, "label")))
      [,1]
pnr    "Person-id"
sex    "Sex"
doBth  "Date of birth"
doDM   "Date of inclusion"
doLast "Date of latest criterion"
doDth  "Date of death"
DMtp   "Type of DM (T1/T2)"
DMtx   "Type of DM (T1/T2/Tx)"
dvdtyp "Type from DVDD"
nprtyp "Type from NPR"
only1  "Only one criterion"
hasdvd "has DVDD record"
inCr   "Incl. criterion"
do2nd  "Date of 2nd of Ins/OAD/NPR"
doNPR  "Date of 1st NPR"
doNPR2 "Date of 2nd NPR"
doOAD  "Date of 1st OAD"
doOAD2 "Date of 2nd OAD"
doIns  "Date of 1st Ins"
doIns2 "Date of 2nd Ins"
doPod  "Date of Podiatry"
doHbA  "Date of HbA1c"
doDia  "Date of diaBase"
doDVD  "Date of DVDD"
```

Thus, `vlabs` is now a character vector with *values* that are the *labels* of the variables, and with a `names` attribute that is the variable *names* in `DMxreg`.

We do not want to carry variable attributes around with the data frame, and we want the date variables in `cal.yr` format:

```
> for(vn in names(DMxreg))
+ for(at in c("label","format.sas") ) attr(DMxreg[,vn], at) <- NULL
> DMxreg <- cal.yr(DMxreg)
```

Further, we define factors as needed. Note that `dvdtyp` and `nprtyp` will have missing values — they are character variables and one value that occur is "" (a zero-length character string—the SAS-representation of missing values in character variables).

```
> DMxreg <- transform(DMxreg,
+   sex = factor(sex),
+   DMtp = factor(DMtp),
+   DMtx = factor(DMtx),
+   inCr = factor(inCr),
+   only1 = factor(only1, labels=c("N","Y")),
+   hasdvd = factor(hasdvd, labels=c("N","Y")),
+   dvdtyp = factor(dvdtyp, levels=c("", "T1", "T2", "Tx"),
+     labels=c("unkn", "T1", "T2", "Tx")),
+   nprtyp = factor(nprtyp, levels=c("", "T1", "T2", "Tx"),
+     labels=c("unkn", "T1", "T2", "Tx")))
> str(DMxreg, v = 0)
```

```
'data.frame':      549852 obs. of  24 variables:
 $ pnr   : chr   ...
 $ sex   : Factor w/ 2 levels "M","W": NULL ...
 $ doBth : 'cal.yr' num  NULL ...
 $ doDM  : 'cal.yr' num  NULL ...
 $ doLast: 'cal.yr' num  NULL ...
 $ doDth : 'cal.yr' num  NULL ...
 $ DMtp  : Factor w/ 2 levels "T1","T2": NULL ...
 $ DMtx  : Factor w/ 3 levels "T1","T2","Tx": NULL ...
 $ dvdtyp: Factor w/ 4 levels "unkn","T1","T2",...: NULL ...
 $ nprtyp: Factor w/ 4 levels "unkn","T1","T2",...: NULL ...
 $ only1 : Factor w/ 2 levels "N","Y": NULL ...
 $ hasdvd: Factor w/ 2 levels "N","Y": NULL ...
 $ inCr  : Factor w/ 13 levels "Dia","DVD","HbA",...: NULL ...
 $ do2nd : 'cal.yr' num  NULL ...
 $ doNPR : 'cal.yr' num  NULL ...
 $ doNPR2: 'cal.yr' num  NULL ...
 $ doOAD : 'cal.yr' num  NULL ...
 $ doOAD2: 'cal.yr' num  NULL ...
 $ doIns : 'cal.yr' num  NULL ...
 $ doIns2: 'cal.yr' num  NULL ...
 $ doPod : 'cal.yr' num  NULL ...
 $ doHbA : 'cal.yr' num  NULL ...
 $ doDia : 'cal.yr' num  NULL ...
 $ doDVD : 'cal.yr' num  NULL ...
```

Finally, we save the register *and* the vector `vlabs` with the variable labels in the same file; it is a handy feature of `save`, that you can save several R-objects in one file, in this case `DMxreg.Rda`; the load command will then load all objects stored in the file (`v=T` causes load to print the objects it loads.)

```
> system.time(save(DMxreg, vlabs,
+   file = paste0(folder, "DMxreg.Rda")))
  bruger    system forløbet
    4.30     0.10     5.17
> system.time(load(file = paste0(folder, "DMxreg.Rda"), v = TRUE))
```

Loading objects:

```
DMxreg
vlab
bruger    system forløbet
  0.73     0.03     0.78
```

3.1.2 The epidemiological diabetes register

Now DMxreg is the extended register with all the administrative variables, so for convenience we also provide a cut-down version that only contains the epidemiologically relevant variables—this will be the register that most persons use.

```
> wh <- match(c("pnr", "sex", "doBth", "doDM", "doDth", "DMtp", "DMtx"),
+           names(DMxreg))
> DMreg <- DMxreg[,wh]
> vlab <- vlab[wh]
> cbind(vlab)
      vlab
pnr   "Person-id"
sex   "Sex"
doBth "Date of birth"
doDM  "Date of inclusion"
doDth "Date of death"
DMtp  "Type of DM (T1/T2)"
DMtx  "Type of DM (T1/T2/Tx)"

> system.time(save(DMreg, vlab,
+                 file = paste0(folder, "DMreg.Rda")))
bruger    system forløbet
  1.75     0.06     2.01

> system.time(load(file = paste0(folder, "DMreg.Rda"), v = TRUE))
```

Loading objects:

```
DMreg
vlab
bruger    system forløbet
  0.83     0.03     0.89
```

3.1.3 The diabetes drug register

There is also a version of the diabetes register where persons are included only on the basis of diabetes drug purchase. They are included at the date of the second drug purchase, but where the type of diabetes is taken from the DMreg. It is thus a subset of the DMreg.

```
> system.time(
+ DMdreg <- as.data.frame(read_sas(paste0(folder, "DMdreg.sas7bdat"))) )
bruger    system forløbet
  2.97     0.06     6.78
```

We want the variable labels for convenience so we get the variable labels from the attributes extracted by read_sas:

```
> cbind(vlab <- sapply(DMdreg, FUN = function(x) attr(x, "label")))
```

```

      [,1]
pnr    "Person id"
sex    "Sex"
DMtp   "Type of DM"
DMtx   "Type of DM (T1/T2/Tx)"
doBth  "Date of birth"
doDM   "Date of inclusion"
doDth  "Date of death"
inCr   "Incl. criterion"
doOAD  "Date of 1st OAD"
doIns  "Date of 1st Ins"

```

Thus, `vlab`s is now a character vector with *values* that are the labels of the variables, and with a `names` attribute that is the variable names.

We do not want to carry variable attributes around with data frame, and we want the date variables in `cal.yr` format:

```

> for(vn in names(DMreg))
+ for(at in c("label","format.sas") ) attr(DMreg[,vn], at) <- NULL
> DMreg <- cal.yr(DMreg)

```

Further, we define factors:

```

> DMreg <- transform(DMreg,
+                   sex = factor(sex),
+                   DMtp = factor(DMtp),
+                   DMtx = factor(DMtx),
+                   inCr = factor(inCr))
> str(DMreg, v = 0)
'data.frame':      478294 obs. of  10 variables:
 $ pnr   : chr    ...
 $ sex   : Factor w/ 2 levels "M","W": NULL ...
 $ DMtp  : Factor w/ 2 levels "T1","T2": NULL ...
 $ DMtx  : Factor w/ 3 levels "T1","T2","Tx": NULL ...
 $ doBth : 'cal.yr' num  NULL ...
 $ doDM  : 'cal.yr' num  NULL ...
 $ doDth : 'cal.yr' num  NULL ...

Comparison of DMreg and DMdreg

For the sake of completeness we compare the two by the dates of inclusion and type of diabetes (we adjust a few rounding errors in DMdreg, coming from cal.yr conversion of dates):

```
> tworeg <- rbind(cbind(DMreg [,c("doDM","DMtx")], reg = "DMreg" ),
+               cbind(DMdreg[,c("doDM","DMtx")], reg = "DMdreg"))
> tt <- with(tworeg, table(floor(pmax(doDM, 1996)), " " = DMtx, " " = reg))
> rCtable(addmargins(tt, 1:2), w = 7, row.vars = 1)
```

	T1		T2		Tx		Sum	
	DMdreg	DMreg	DMdreg	DMreg	DMdreg	DMreg	DMdreg	DMreg

3.2 The population files

First the paraphernalia:

```
-----
Code: E:/workdata/707655/DMreg2020/r/mkPop.rnw
Time: 2022-01-27 at 16:13:18
-----
```

The file we produce contains the `pnr`, sex, dates of birth and death from the population files and the reclassified causes of death and country of birth from the cause of death files. We retrieve data from the SAS-files POP (population) and COD (cause of death):

```
> system.time(pop <- as.data.frame(read_sas("../data/pop.sas7bdat")))
  bruger    system forløbet
  38.63     0.61    45.24

> attr( pop$pnr, "label"      ) <- NULL
> attr( pop$pnr, "format.sas" ) <- NULL
> str(pop, v = 0)

'data.frame':      8298837 obs. of  4 variables:
 $ pnr  : chr    ...
 $ sex  : chr    ...
 ..- attr(*, "label")= chr    ...
 $ doBth: Date, format:  ...
 $ doDth: Date, format:  ...
 - attr(*, "label")= chr    ...

> system.time(cod <- as.data.frame(read_sas("../data/cod.sas7bdat")))
  bruger    system forløbet
  11.62     0.09    14.74

> attr( cod$pnr, "label"      ) <- NULL
> attr( cod$pnr, "format.sas" ) <- NULL
> str(cod, v = 0)

'data.frame':      1319351 obs. of  10 variables:
 $ pnr  : chr    ...
 $ doDth: Date, format:  ...
 $ cod4  : chr    ...
 ..- attr(*, "label")= chr    ...
 $ codX  : chr    ...
 ..- attr(*, "label")= chr    ...
 $ codD  : chr    ...
 ..- attr(*, "label")= chr    ...
 $ daar  : chr    ...
 ..- attr(*, "label")= chr    ...
 $ daa1  : chr    ...
 ..- attr(*, "label")= chr    ...
 ..- attr(*, "format.sas")= chr    ...
 $ daa2  : chr    ...
 ..- attr(*, "label")= chr    ...
 ..- attr(*, "format.sas")= chr    ...
 $ daa3  : chr    ...
 ..- attr(*, "label")= chr    ...
 ..- attr(*, "format.sas")= chr    ...
 $ daa4  : chr    ...
 ..- attr(*, "label")= chr    ...
 ..- attr(*, "format.sas")= chr    ...
```

There is not the same number of deaths in the two files; and even the two dates of death do not always match:

```
> fCp(table(!is.na(pop$doDth)))
  FALSE    TRUE
6,891,367 1,407,470

> fCp(table(!is.na(cod$doDth)))
```

```

```

We see that the cause of death file (doDth.y) only have dates of death till 2019 incl. and that

there is a tendency that discrepancies are concentrated around dates of death from `cod` being 10 years earlier the date of death in the `pop` file. So we conclude that the date of death obtained from the `pop` file is the correct one; essentially we ascribe discrepancies to misrecordings of dates of death on death certificates. Also this is more complete over the years 2018 and 2019 too.

```
> pop <- data.frame(pnr = jj$pnr,
+                 sex = factor(jj$sex),
+                 doBth = jj$doBth,
+                 doDth = jj$doDth.x,
+                 cod4 = factor(jj$cod4),
+                 codX = factor(jj$codX),
+                 stringsAsFactors = FALSE)
> with( pop, rCtable( addmargins(table(has.cod = !is.na(codX),
+                                     has.doDth = !is.na(doDth) )), w=9 ) )
```

Note the there are very few deaths from diabetes; this is because this cause of death has been taken as the secondary or tertiary cause if the first or two first recorded causes were diabetes. This is specific for this project because we are primarily interested in comparing mortality between diabetes patients and other persons, and so diabetes as a cause of death in itself is not relevant, we would want to see the underlying cause(s) instead.

```
> str(pop, v=0)
'data.frame':      8298837 obs. of  6 variables:
 $ pnr   : chr      ...

> save(pop,          file = "../data/pop.Rda")
> system.time(load(file = "../data/pop.Rda"))

bruger      system forløbet
 6.69       0.10       6.83
```

3.2.1 The migration file

The migration file has one record for each period a person is *outside* of Denmark, signified by `doEm < doIm`. Thus a person that is born outside of Denmark and immigrates to Denmark has a first record with `doEm=NA`. A person that has left Denmark and not (yet) come back will have a last record with `doIm=NA`.

We read the SAS dataset, remove the variable attributes and convert dates to `cal.yr` format:

```
> system.time(xDK <- as.data.frame(read_sas("../data/xDK.sas7bdat")))
  bruger    system forløbet
  5.89     0.11     7.23
> names(xDK)[1] <- "pnr"
> attr(xDK$pnr, "label"      ) <- NULL
> attr(xDK$pnr, "format.sas" ) <- NULL
> xDK <- cal.yr(xDK)
> str(xDK, v = 0)
'data.frame':      2179873 obs. of  3 variables:
 $ pnr : chr      ...
 $ doEm: 'cal.yr' num  NULL ...
 $ doIm: 'cal.yr' num  NULL ...
 - attr(*, "label")= chr      ...
> attr(xDK, "label")
[1] "Periods spent outside DK: doEm < doIm"
> rCtable(with(xDK, table(hasEm = !is.na(doEm),
+                        hasIm = !is.na(doIm),
+                        doEm < doIm,
+                        exclude = NULL))))
              TRUE      NA
hasEm hasIm
FALSE FALSE      .      .
      TRUE      . 869,505
TRUE  FALSE      . 758,003
      TRUE  552,365      .
> save(xDK, file = "../data/xDK.Rda")
```

```
-----
Code: E:/workdata/707655/DMreg2020/r/mkPop.rnw
Ends: 2022-01-27 at 16:15:36
Time elapsed:      00:02:18
-----
```

3.3 The status file

```
-----
Code: E:/workdata/707655/DMreg2020/r/mkStat.rnw
Time: 2022-03-15 at 11:53:23
-----
```

The status file is classified by `pnr` and `yr`, each record representing a person's status at 1 January of the year `yr`. There are records for *all* residents in Denmark. The status variables are place of residence, family income and highest achieved education. They all appear in different forms.

3.3.1 Converting the SAS dataset to .Rda format

We now read the SAS dataset and convert it to an R-dataset for easier (and quicker) access:

```
> system.time(
+   popstat <- as.data.frame(read_sas("../data/popstat.sas7bdat"))
  bruger   system forløbet
2605.55    9.57  2857.00

> names(popstat) <- tolower(names(popstat))
> for(v in names(popstat))
+   {
+   attr(popstat[,v], "label") <- NULL
+   attr(popstat[,v], "format.sas") <- NULL
+   }
> str(popstat, v = 0)

'data.frame':      148346675 obs. of  10 variables:
 $ pnr      : chr   ...
 $ antboernh : num  NULL ...
 $ kom      : chr   ...
 $ reg      : chr   ...
 $ yr       : num  NULL ...
 $ familie_id: chr   ...
 $ find     : num  NULL ...
 $ udd      : num  NULL ...
 $ udddk    : num  NULL ...
 $ eduen    : num  NULL ...
- attr(*, "label")= chr   ...
```

We then read the file with the character formats for geography and education (generated in the SAS program 00y-base.sas) in order to get the correct factor levels for kom, reg, udddk and eduen:

```
> labs <- read_sas("../data/statlabels.sas7bdat")
> labs$START <- as.numeric(labs$START)
> table( labs$FMTNAME )

AUDD_HOVED_L5L5_T  AUDD_LEVEL_L4L4_T      KOM_V4_T      REG_V4_T
                15                    9             99             6

> (kl <- labs[grep("KOM" ,labs$FMTNAME),c("LABEL","START")])

# A tibble: 99 x 2
  LABEL      START
  <chr>      <dbl>
1 København  101
2 Frederiksberg 147
3 Ballerup    151
4 Brøndby     153
5 Dragør      155
6 Gentofte    157
7 Gladsaxe    159
8 Glostrup   161
9 Herlev      163
10 Albertslund 165
# ... with 89 more rows

> (rl <- labs[grep("REG" ,labs$FMTNAME),c("LABEL","START")][,-1,])
```

```

# A tibble: 5 x 2
  LABEL      START
  <chr>      <dbl>
1 Nordjylland      81
2 Midtjylland      82
3 Syddanmark       83
4 Hovedstaden      84
5 Sjælland         85

> (ul <- labs[grep("HOVED",labs$FMTNAME),c("LABEL","START")])

# A tibble: 15 x 2
  LABEL      START
  <chr>      <dbl>
1 Førskoleuddannelser      5
2 Grundskole                10
3 Forberedende uddannelser  15
4 Gymnasiale uddannelser    20
5 Danskundervisning ved sprogcentre 25
6 Erhvervsfaglige grundforløb 29
7 Erhvervsfaglige uddannelser 30
8 Adgangsgivende uddannelsesforløb 35
9 Arbejdsmarkedsuddannelser, AMU 39
10 Korte videregående uddannelser, KVV 40
11 Mellemlange videregående uddannelser, MVU 50
12 Bacheloruddannelser, BACH 60
13 Lange videregående uddannelser, LVU 70
14 Ph.d. og forskeruddannelser 80
15 Uoplyst mv.              90

> (el <- labs[grep("LEVEL",labs$FMTNAME),c("LABEL","START")])

# A tibble: 9 x 2
  LABEL      START
  <chr>      <dbl>
1 Early childhood education  0
2 Primary                    1
3 Lower secondary            2
4 Upper secondary            3
5 Short cycle tertiary        5
6 Bachelor or equivalent     6
7 Master or equivalent        7
8 Doctoral or equivalent      8
9 Not elsewhere classified    9

```

These are the in turn used to define the relevant variables as factors:

```

> system.time(
+ popstat <-
+ mutate(popstat,
+   kom = factor( kom, levels = k1$START, labels = k1$LABEL),
+   reg = factor( reg, levels = r1$START, labels = r1$LABEL),
+   udddk = factor(udddk, levels = ul$START, labels = ul$LABEL),
+   eduen = factor(eduen, levels = el$START, labels = el$LABEL))

bruger      system forløbet
248.73      1.65      250.39

```

3.3.2 Creating income deciles

Income levels change over a period as long as the the one covered by these data (1996–2020, 24 years), so we construct a factor of deciles of income for each year, `findec`, family income decile, and finally `ungroup` the tibble before we save it:

```
> system.time(
+ popstat <- ( group_by(popstat, yr)
+             %>% mutate(findec = factor(
+                 as.integer(
+                 cut(find,
+                     quantile(find,
+                               0:10/10,
+                               na.rm = TRUE))))))
+             %>% ungroup()
+             )
+ bruger      system forløbet
+ 49.92       2.66      52.57

> attr(popstat$findec, "label") <- "fam. indk. decil pr. yr"
```

3.3.3 Saving the file for future use

Finally, we save the data as an R-file and load it again to demonstrate the time it likely takes to load it. First we rearrange the order of the variables to make it more logical.

```
> popstat <- as.data.frame(popstat[,c("pnr", "yr", "reg", "kom",
+                                     "udd", "udddk", "eduen",
+                                     "find", "findec",
+                                     "familie_id", "antboernh")])
> str(popstat, v = 0)
'data.frame':      148346675 obs. of  11 variables:
 $ pnr      : chr   ...
 $ yr       : num  NULL ...
 $ reg      : Factor w/ 5 levels "Nordjylland",...: NULL ...
 $ kom      : Factor w/ 99 levels "København","Frederiksberg",...: NULL ...
 $ udd      : num  NULL ...
 $ udddk    : Factor w/ 15 levels "Førskoleuddannelser",...: NULL ...
 $ eduen    : Factor w/ 9 levels "Early childhood education",...: NULL ...
 $ find     : num  NULL ...
 $ findec   : Factor w/ 10 levels "1","2","3","4",...: NULL ...
 ..- attr(*, "label")= chr   ...
 $ familie_id: chr   ...
 $ antboernh : num  NULL ...

> rCtable(cbind(table(popstat$yr)))
      A
1995  5,210,466
1996  5,245,127
1997  5,268,800
1998  5,288,526
1999  5,308,412
2000  5,324,505
2001  5,344,465
2002  5,363,002
```

```

2003  5,378,270
2004  5,391,853
2005  5,406,591
2006  5,423,306
2007  5,447,075
2008  5,475,682
2009  5,511,247
2010  5,534,637
2011  5,560,522
2012  5,580,429
2013  5,602,535
2014  5,627,159
2015  5,659,654
2016  5,707,176
2017  5,748,720
2018  5,781,131
2019  5,806,044
2020  5,711,375
2021  5,639,966

> system.time(save(popstat, file="../data/popstat.Rda"))
  bruger    system forløbet
  884.92    10.84  1053.29

> rm(popstat)
> system.time(load(          file="../data/popstat.Rda"))
  bruger    system forløbet
  237.12     3.73   292.31

```

So the R-version of the `popstat` dataset loads about 10 times faster than the SAS-version, and it is properly equipped with factors for residence (`kom`, `reg`), income decile (`findex`) and educational level (`udddk`, `eduen`).

```

```

3.4 The population Lexis object

In order to have the entire population as a Lexis object, we read the Danish population data and set up a Lexis object:

```

> system.time(
+ load("../data/pop.Rda", v = TRUE))
Loading objects:
  pop
  bruger    system forløbet
  21.85     0.20   22.08

```

```
> rpop <- pop
> str(rpop, v = 0)
'data.frame':      8298837 obs. of  6 variables:
 $ pnr   : chr      ...
 $ sex   : Factor w/ 2 levels "M","W": NULL ...
 $ doBth: 'cal.yr' num  NULL ...
 $ doDth: 'cal.yr' num  NULL ...
 $ cod4  : Factor w/ 4 levels "Can","CVD","Oth",...: NULL ...
 $ codX  : Factor w/ 10 levels "Cancer","CVD",...: NULL ...
```

We set up a Lexis object with FU from entry to death in the period 1996–2020 incl.:

```
> rpop$doE <- pmax(rpop$doBth, 1996, na.rm = TRUE)
> rpop$doX <- pmin(rpop$doDth, 2021, na.rm = TRUE)
> system.time(
+ pL <- Lexis(entry = list(per = doE,
+                          age = doE - doBth),
+            exit = list(per = doX,
+                        exit.status = factor(!is.na(doDth) & doDth < 2021,
+                                           labels = c("noDM","Dead")),
+            id = pnr,
+            data = rpop) %>% select(-pnr))
NOTE: entry.status has been set to "noDM" for all.
NOTE: Dropping 2775 rows with duration of follow up < tol
  bruger  system forløbet
  15.46    0.55    16.02
> summary(pL, timescales = TRUE)
```

Transitions:

```
To
From      noDM    Dead  Records:  Events:  Risk time:  Persons:
noDM 6891367 1404695  8296062  1404695  168669007  8296062
```

```
> str(pL, v = 0)
```

```
Classes 'Lexis' and 'data.frame':      8296062 obs. of  13 variables:
 $ per   : num  NULL ...
 $ age   : num  NULL ...
 $ lex.dur: num  NULL ...
 $ lex.Cst: Factor w/ 2 levels "noDM","Dead": NULL ...
 $ lex.Xst: Factor w/ 2 levels "noDM","Dead": NULL ...

 ..$ per: NULL
 ..$ age: NULL
```

pL is now a Lexis object with one record per person who has been residing in DK between 1996-1-1 and 2020-12-31. Some persons in pop were outside this window, hence the dropped persons when constructing pL.

3.4.1 Reading migration data

We read the Danish migration data and restrict to the persons present in the Lexis object `p1`:

```
> load("../data/xDK.Rda", v = TRUE)
Loading objects:
  xDK
> xDK <- subset(xDK, pnr %in% pL$lex.id)
```

Now create a long-form version of the movements, with missing emigration dates recoded as 1990 (assuming that those with only an immigration date have left a long time ago) and missing immigration date as 2030 (assuming that those with only an emigration date will stay out way beyond follow-up):

```
> migx <- transform(xDK,
+                   doEm = ifelse(is.na(doEm), 1990, doEm),
+                   doIm = ifelse(is.na(doIm), 2030, doIm))
> migr <- rbind(transform(migx,
+                         lex.id = pnr,
+                         new.state = "out",
+                         cut = doEm),
+              transform(migx,
+                         lex.id = pnr,
+                         new.state = "noDM",
+                         cut = doIm))[,c("lex.id", "cut", "new.state")]
> str(migr, v = 0)
'data.frame':      4359738 obs. of  3 variables:
 $ lex.id   : chr    ...
 $ cut      : num  NULL ...
 $ new.state: chr    ...
> who.migr <- unique(migr$lex.id) # any person with at least one migration record
> rCp(length(who.migr))
[1] 1,525,052
> rCp( sum(who.migr %in% pop$pnr))
[1] 1,525,052
```

The point is now to use this to create the relevant "holes" in the initial Lexis object; we call the "being in Denmark" state `noDM` because we eventually will add diabetes status to the data. The dataset has alternating values of `new.state`, (`noDM` / `out`), and the aim is to exclude the time in the `out` state.

3.4.2 Carving out the emigrated time

We subdivide the population by the presence of migration records (and who are in the population file):

```
> onlyDK <- subset(pL, !(lex.id %in% who.migr)) ; nrow(onlyDK)
[1] 6771010
> migrDK <- subset(pL, lex.id %in% who.migr ) ; nrow(migrDK)
[1] 1525052
```

```
> migr <- subset(migr, lex.id %in% migrDK$lex.id)
> rCp(c(nrow(migr), nrow(migrDK)))
[1] 4,359,738 1,525,052
```

First we cut the follow-up at the migration dates for those that have at least one migration record. We do this in 100 chunks of persons; experiments showed that computing time increased more than linearly by the number of persons in the dataset:

```
> N <- length(who.migr)
> nch <- 100
> lim <- floor(seq(0, N, length.out = nch+1))
> mL <- NULL
> for (i in 1:nch)
+   {
+     cat(format(t0 <- Sys.time(), "%F, %T,")
+     xwho <- who.migr[(lim[i]+1):lim[i+1]]
+     mL <- rbind(mL,
+                 rcutLexis(subset(migrDK, lex.id %in% xwho),
+                               subset(migr , lex.id %in% xwho)))
+     cat(formatC(Sys.time() - t0,
+                 format = "f",
+                 digits = 1,
+                 width = 5), "seconds for chunk", i, "\n")
+   }
2022-02-17, 12:56:45, 21.5 seconds for chunk 1
2022-02-17, 12:57:06, 31.1 seconds for chunk 2

```

We now exclude the follow-up in the out state, and also merge the states noDM and out—the latter only exists in `lex.Xst` after excluding records with `lex.Cst` equal to out:

```

> inDK <- Relevel(subset(mL, lex.Cst != "out"),
+               list("noDM" = 1:2))
> summary(inDK)

```

```
Transitions:
```

```

      To
From   noDM  Dead  Records:  Events: Risk time:  Persons:
noDM 1828056 18993   1847049   18993   13953489   1357995

```

```

> inDK <- rbind(inDK, onlyDK)
> summary(inDK)

```

```
Transitions:
```

```

      To
From   noDM      Dead  Records:  Events: Risk time:  Persons:
noDM  7225632 1392427   8618059  1392427  146689844   8129005

```

Finally we save the population Lexis object:

```
> save(inDK, file = "../data/inDK.Rda")
```

```

-----
Code: E:/workdata/707655/DMreg2020/r/inDK.rnw
Ends: 2022-02-17 at 13:45:51
Time elapsed:      00:50:38
-----

```

```

-----
Code: E:/workdata/707655/DMreg2020/r/mkTabs/fuDM.rnw
Time: 2022-03-11 at 17:24:41
-----

```

3.4.3 Reading population data

We read the Danish population data in the form of a `Lexis` object with holes of non-residency in the follow-up, and the anonymized person-id is in the variable `lex.id`:

```
> getwd()
[1] "E:/workdata/707655/DMreg2020/r/mkTabs"
> system.time(load(file = ".././data/inDK.Rda", v = TRUE))
Loading objects:
  inDK
  bruger    system forløbet
    20.37    0.20    20.60
> summary(inDK)
Transitions:
  To
From      noDM    Dead  Records:  Events: Risk time:  Persons:
  noDM 7225632 1392427  8618059  1392427  146689844  8129005
> str(inDK, v = 0)
Classes 'Lexis' and 'data.frame':      8618059 obs. of  13 variables:

..$ age: NULL
- attr(*, "time.scales")= chr [1:2] ...
- attr(*, "time.since")= chr [1:2] ...
```

3.4.4 Adding diabetes status

The purpose is now to subdivide the follow-up in `inDK` by diabetes status.

To this end we merge with the diabetes register (join by `pnr/lex.id`) and then cut the `Lexis` object at `doDM`. The result should be a follow-up `Lexis` object with follow up time only while resident in Denmark, classified by diabetes status (`noDM/T1/T2`):

```
> system.time(
+   load(".././data/DMreg.Rda", v = TRUE))
Loading objects:
  DMreg
  vlabs
  bruger    system forløbet
    0.64    0.02    0.67
```

```

> DMreg <- rename(DMreg, "lex.id" = "pnr")
> str(DMreg, v = 0)
'data.frame':      549852 obs. of  7 variables:
 $ lex.id: chr      ...
 $ sex   : Factor w/ 2 levels "M","W": NULL ...
 $ doBth : 'cal.yr' num  NULL ...
 $ doDM  : 'cal.yr' num  NULL ...
 $ doDth : 'cal.yr' num  NULL ...
 $ DMtp  : Factor w/ 2 levels "T1","T2": NULL ...
 $ DMtx  : Factor w/ 3 levels "T1","T2","Tx": NULL ...

> system.time(dL <- left_join(inDK,
+                             select(DMreg, c(lex.id, doDM, DMtp))))
  bruger    system forløbet
    5.03     0.20     5.25

> summary(dL)
Transitions:

  T2     490953
  T1     56969
  Sum    8129005

```

DMfup is now a Lexis object with follow-up in three states: noDM, T1 and T2—some 8.1 mil. persons and 9.1 mil. records.

3.4.5 The population by diabetes status, corrected for migration pattern

For persons with a migration history, only time registered as being resident in DK is included; so some persons have several records if the person has had distinct periods of residency in DK. Moreover persons with a diagnosis of diabetes will have separate records for the time before and after diagnosis of diabetes.

```
> save(DMfup, file = ".././data/DMfup.Rda")
> system.time(
+   load(file = ".././data/DMfup.Rda", v = TRUE))
Loading objects:
  DMfup
  bruger    system forløbet
  10.91     0.30    11.67
```

3.4.6 Comparison with the raw DMreg

We can check out how many persons with T1, resp T2 there are in the Lexis object DMfup:

```
> t1pnr <- unique(subset(DMfup, lex.Cst == "T1")$lex.id)
> t2pnr <- unique(subset(DMfup, lex.Cst == "T2")$lex.id)
> alpnr <- unique(      DMfup                $lex.id)
> rCp(c(T1 = length(t1pnr),
+       T2 = length(t2pnr),
+       DM = length(t1pnr) + length(t2pnr),
+       noDM = length(alpnr) -
+         length(t1pnr) - length(t2pnr)))
      T1      T2      DM      noDM
56,969 490,953 547,922 7,581,083
> with(DMreg, rCp(addmargins(table(DMtp))))
DMtp
      T1      T2      Sum
57,086 492,766 549,852
```

We see there are about 2000 of the persons in DMreg that are not in the migration-corrected data DM.

We also see that some of the persons in DMfup with a valid doDM are diagnosed outside active follow-up — well we cannot see this directly because it would be listing of microdata.

```
> DMout <-
+ as.data.frame( # only persons with a DM diagnosis
+   subset(DMfup, !is.na(doDM))
+   %>% select(-c(sex, age, doDth, cod4, codX, doE, doX, doBth, DMtp))
+   # doDM in a follow-up interval
+   %>% mutate(inFU = (per <= doDM &
+     doDM <= (per + lex.dur)),
+     perX = per + lex.dur)
+   # process by person
+   %>% group_by(lex.id)
+   # only those with all intervals without doDM
+   # that is the doDM is outside of DK residency
+   %>% filter(all(!inFU))
+   # remove grouping
+   %>% ungroup
+ )
> # head(subset(DMout, doDM > 1996)[,c(5,1,8,6,2,3,4)], 15)
```

DMout is now a dataset (Lexis object, actually) with a valid doDM outside DK:

```
> with(subset(DMout, lex.Cst=="noDM"), nrec(doDM, lex.id))
```

```

No. recs (Nrec),
no. valid: Val(doDM)
no. distinct: Dis(lex.id)
table of lex.id by no. valid n(doDM)
-----
Nrec          1,137
Val(doDM)     1,137
Dis(lex.id)    959
n(doDM)=1     810
2              123
3              23
4              *

> with(subset(DMout, lex.Cst!="noDM"), nrec(doDM, lex.id))

```

```

No. recs (Nrec),
no. valid: Val(doDM)
no. distinct: Dis(lex.id)
table of lex.id by no. valid n(doDM)
-----
Nrec          88,535
Val(doDM)     88,535
Dis(lex.id)   87,535
n(doDM)=1    86,734
2             650
3            121
4             22
5              4
6              *
7              *
10+           *

```

We see that there are many persons with a valid `doDM` not in the follow-up in the data set. Most of these records represent follow-up in one of the diabetes states (T1, T2), i.e. with the `doDM` *before* the follow-up.

This presumably means that the persons may not really have been outside DK when diagnosed; `doDM` by construction correspond to a recorded date in one of the registers used. We cannot include these periods as valid follow-up on the basis of an existing `doDM`, because similar intervals could not be included for persons without a valid `doDM`.

An alternative approach would be to only exclude follow-up prior to immigration, that is to count everyone as permanently in DK after the first recorded entry.

3.5 Follow-up by sex, age and calendar time

First we load the `Lexis` object with the follow-up in states by diabetes and restricted to residency in Denmark:

```
> system.time(
+   load(file = "../data/DMfup.Rda", v = T))
Loading objects:
  DMfup
  bruger    system forløbet
    25.94    0.41    26.47
> summary(DMfup)
Transitions:

```

We split the follow-up by age and calendar time in 1-year intervals in order to allocate the follow-up in groups; note that the `floor` defines the classes; no piece of follow-up crosses any age or period-border:

```
> system.time(
+ sL <- splitMulti(DMfup,
+                 age = 0:100,
+                 per = 1996:2021))
  bruger    system forløbet
 786.14 1456.28 740.74
> system.time(
+ sL <- mutate(sL,
+              a1 = floor(age),
+              p1 = floor(per)))
  bruger    system forløbet
 4.61    0.61    5.22
> summary(sL)

  noDM  8041165
   T2   490877
   T1   56969
  Sum   8128259

```

We now have FU split in the pieces we need, so now we can define the events of interest (T1, T2 and Dead) and the risk time (person-years, `lex.dur`).

```

> system.time(
+ xL <- transform(sL,
+                 T1 = lex.Xst == "T1" & lex.Xst != lex.Cst,
+                 T2 = lex.Xst == "T2" & lex.Xst != lex.Cst,
+                 Dth = lex.Xst == "Dead",
+                 Y = lex.dur))
  bruger    system forløbet
  33.69     2.89    36.58

> names(xL) ; fCp(dim(xL))
 [1] "lex.id"  "per"    "age"    "lex.dur" "lex.Cst" "lex.Xst" "sex"
 [8] "doBth"   "doDth"  "cod4"   "codX"    "doE"     "doX"     "doDM"
[15] "DMtp"    "a1"     "p1"     "T1"      "T2"      "Dth"     "Y"
 [1] 295,577,581      21

```

We want these new variables aggregated (added) for all combinations of sex, age and calendar time:

```

> system.time(
+ DMtab <- aggregate(xL[,c("T1", "T2", "Dth", "Y")],
+                   by = xL[,c("sex", "p1", "a1", "lex.Cst")],
+                   FUN = sum))
  bruger    system forløbet
  974.86    28.33  1003.26

> names(DMtab)
 [1] "sex"      "p1"      "a1"      "lex.Cst" "T1"      "T2"      "Dth"
 [8] "Y"

> rCp(nrow(DMtab))
 [1] 14,838

> table(DMtab$lex.Cst)
noDM  T2  T1  Dead
5000 4889 4949  0

```

Thus, `DMtab`, has events and person-years classified by sex, age and calendar time.

We can see how many of the events occur in cells with too few:

```

> rCp(addmargins(tapply(DMtab$T1, DMtab$T1 < 3, sum)))
  FALSE    TRUE    Sum
  27,626    1,126  28,752

> rCp(addmargins(tapply(DMtab$T2, DMtab$T2 < 3, sum)))
  FALSE    TRUE    Sum
  430,968    605  431,573

> rCp(addmargins(tapply(DMtab$Dth, DMtab$Dth < 3, sum)))

```

```

      FALSE      TRUE      Sum
1,380,469      2,156 1,382,625

```

We now have the tabulation of events both in 1-year intervals; we save these for subsequent use and analysis.

```
> save(DMtab, file = "../data/DM-inc-mort.Rda")
```

```

- attr(*, "breaks")=List of 2
 ..$ per: num [1:26] NULL ...
 ..$ age: num [1:101] NULL ...
```

This is a tabulated dataset, classified by sex (`sex`), age in 1-year classes (`a1`), calendar time in 1-year classes (`p1`) and diabetes status, (`noDM`, `T1`, `T2` — `lex.Cst`). But we do not want the silly name of the variable nor the extra unused level:

```
> DMtab$DMst <- factor(DMtab$lex.Cst)
> table(DMst = DMtab$DMst, lex.Cst = DMtab$lex.Cst)
```

```

      lex.Cst
DMst  noDM  T2   T1 Dead
noDM 5000   0    0   0
T2    0 4889   0    0
T1    0    0 4949   0

```

In each of the combinations of the states is counted the number of T1 incidents (`T1`), T2 incidents (`T2`) and deaths (`Dth`), and aggregated the amount of risk time (`Y`).

The primary use of this is for analysis of rates of T1 and T2 and death.

3.5.1 Tabulation for international consortium

We need a tabulation that is exportable, so we coarsen the age-distribution to 0–20, 20–25, ..., 85–90, 90+. Actually the 90+ is only 90–100; persons over 100 were excluded in the age-split by `splitMulti`:

```
> DMtab$a5 <- cut(DMtab$a1,
+               c(0, seq(20, 90, 5), Inf),
+               right = FALSE)
> print(with(DMtab, table(a1, a5)), z = ".")
```

We cannot export entries under 3, so we convert these to NA before exporting them, and check that no entries less than 3 are left:

```

> cnt <- c("T1", "T2", "Dth")
> for (cc in cnt)
+   DMtab5[,cc] <- ifelse(DMtab5[,cc] > 0 &
+   DMtab5[,cc] < 3,
+   NA,
+   DMtab5[,cc])
> addmargins(table(pmin(DMtab5$T1 , 5)))
  0  3  4  5 Sum
1627 20 18 696 2361
> addmargins(table(pmin(DMtab5$T2 , 5)))
  0  5 Sum
1600 800 2400
> addmargins(table(pmin(DMtab5$Dth, 5)))
  0  3  4  5 Sum
157 42 26 1970 2195

```

Finally we can subdivide the tabulated object by status and provide the relevant tables:

```
> names(DMtab5)
```

```
[1] "sex" "p1" "a5" "DMst" "T1" "T2" "Dth" "Y"
> T1tab <- subset(DMtab5,
+               DMst == "T1",
+               select = c(sex, p1, a5, Dth, Y)) %>%
+   rename("T1Dth" = "Dth",
+          "T1pY" = "Y")
> T2tab <- subset(DMtab5,
+               DMst == "T2",
+               select = c(sex, p1, a5, Dth, Y)) %>%
+   rename("T2Dth" = "Dth",
+          "T2pY" = "Y")
> nDtab <- subset(DMtab5,
+               DMst == "noDM",
+               select = c(sex, p1, a5, T1, T2, Dth, Y)) %>%
+   rename("nDT1i" = "T1",
+          "nDT2i" = "T2",
+          "nDDth" = "Dth",
+          "nDpY" = "Y")
> imTab <- full_join(full_join(T1tab, T2tab), nDtab)
> str(imTab, v = 0)

'data.frame':      800 obs. of  11 variables:
 $ sex  : Factor w/ 2 levels "M","W": NULL ...
 $ p1   : num  NULL ...
 $ a5   : Factor w/ 16 levels "[0,20)","[20,25)",...: NULL ...

```

3.6 The complications files

First the paraphernalia:

```

> library( Epi )
> library( tidyverse )
> library( haven )
> source("E:/workdata/707655/util/elapsed.r")
> setwd("E:/workdata/707655/DMreg2020/r")
> start()

```

```

-----
Code: E:/workdata/707655/DMreg2020/r/mkCompl.rnw
Time: 2022-01-26 at 13:28:40
-----

```

Complications occurring in the entire Danish population (*i.e.* not only among diabetes patients) have been gathered in two SAS files:

wcompl: One record per person with at least one complication, key is **pnr**, and with further 34 variables, namely the date of first occurrence of each of the 34 (groups of) complications.

rcmpl: One record per person and recurrent complication (hypoglycaemia: **HpoG**, ketoacidosis: **Keto**, myocardial infarction: **MI** and stroke: **Str**). The key in the file is (**pnr**, **compl**, **doC**), and there are no other variables in the dataset.

3.6.1 The SAS programs generating the complications files

The first program, `10-labcomp` defines complications based on the lab-measurements in LABKA and DVDD. Since some measurements may actually be the same between the two data bases, we exclude any measurement less than 4 days after a previous one of the same kind.

We compute eGFR based on the plasma creatinine measurement and the sex and age of the persons at the date of measurement.

The diagnoses of moderate, severe and end stage kidney disease (**ModL**, **SevL**, **ESRL**) are defined as two measurements of eGFR below 60, 30, resp. 15 with at least 60 days interval. Correspondingly, diagnoses of micro- and macro-albuminuria (**MicA**, **MacA**) are defined as two measurements of albumin/creatinine ratio (mg/g) or albumin excretion (mg/24 h) above 30 resp. 300 with at least 60 days interval. Both for kidney disease and albuminuria, the date of the complication is defined as the date of the second measurement beyond the threshold.

Note that there are also kidney complications based exclusively on diagnosis and procedure codes (**ModL**, **SevL**, **ESRL**)

The first of each of the dates where these criteria are met are stored in a SAS data set `DMdat.micompl` with key (**pnr**,**compl**), and only non-key variable **doC**, date of first occurrence of the complication.

The second program, `10-compl` extracts complications from NPR, (from all types of records), and for each type of complication takes the first of these within each person.

The full listings of `.log` and `.lst` files from these SAS-programs (plus quite a few more) are in the document `v:\sdc\469drive\DMreg2020\tex\DMreg2020.pdf`

3.6.2 Converting SAS datasets to .Rda format

We now read the SAS datasets and convert them to R-datasets for easier access:

```
> system.time(wcompl <- read_sas("../data/wcompl.sas7bdat"))
  bruger    system forløbet
  28.95      0.48    53.80

> system.time(rcmpl <- read_sas("../data/rcmpl.sas7bdat"))
  bruger    system forløbet
   6.09      0.11     8.94

> names(wcompl) ; fCp(nrow(wcompl)) ; fCp(object.size(wcompl))
 [1] "PNR"      "doESRD" "doHypD" "doMI"    "doMedA" "doMinA" "doReti" "doTCI"  "doUppA"
[10] "doAFib"   "doIHDx" "doIStr"  "doMicA"  "doModL" "doMAtd" "doModC" "doHF"   "doHpoG"
[19] "doHStr"   "doSevL" "doNeur"  "doMacA"  "doKeto" "doESRL" "doSevC" "doAmp"  "doCVD"
[28] "doCbVD"   "doNefr" "doDNef"  "doNefL"  "doIHD"  "doStr"  "doACD"  "doMajA"

 [1] 1,961,504
```

```
[1] 674,786,544
> names(rcompl) ; fCp(nrow(rcompl)) ; fCp(object.size(rcompl))
[1] "pnr" "compl" "doC"
[1] 2,389,593
[1] 103,650,064
```

Complication grouping

The grouping of complications comes from two different places; the formats defined the file `complfmt.csv`:

```
> fmt <- read.csv('../fmts/compfmt.csv', as.is = TRUE)
> a2t <- subset(fmt, FMTNAME == "$ab2abtx" & LABEL != 'Other')
> abn <- a2t$LABEL
> names(abn) <- a2t$START
> abb <- subset(fmt, FMTNAME == "$sub2grp" & LABEL != 'Other')
> print(with(abb, table(START, LABEL)), z = '.')
```

START	Amp	CbVD	CVD	DNef	HpoG	Keto	MAtd	NefL	Nefr	Neur	Reti
AFib	.	.	1
ESRD	1	.	.
ESRL	1	.	.	.
HF	.	.	1
HpoG	1
HStr	.	1
HypD	.	.	1
IHDx	.	.	1
IStr	.	1
Keto	1
MacA	.	.	.	1
MAtd	1
MedA	1
MI	.	.	1
MicA	.	.	.	1
MinA	1
ModC	1	.	.
ModL	1	.	.	.
Neur	1	.
Reti	1
SevC	1	.	.
SevL	1	.	.	.
TCI	.	1
UppA	1

```
> tt <- data.frame(with(abb, table(START, LABEL)))
> tt <- tt[tt$Freq==1,2:1]
> diag <- as.character(tt$START)
> grp <- as.character(tt$LABEL)
```

We can then list the groupings of the complications:

```
> print(data.frame(grp, abn[diag]),
+       right = FALSE,
+       row.names = FALSE)
```

```

grp  abn.diag.
Amp  MedA: Medium amputation
Amp  MinA: Minor amputation
Amp  UppA: Upper amputation
CbVD HStr: Haemmoragic stroke
CbVD IStr: Ischaemic stroke
CbVD TCI: Transient cerebral ischaemia
CVD  AFib: Atrial fibrillation
CVD  HF: Heart failure
CVD  HypD: Hypertensive disease
CVD  IHDx: non-MI Ischeamic heart disease
CVD  MI: Myocardial Infarction
DNef MacA: Macro-abuminuria
DNef MicA: Micro-abuminuria
HpoG HpoG: Hypoglyceamia
Keto Keto: Ketoacidosis
MAtd MATd: Macrovascular atherosclerotic disease
NefL ESRL: End-stage CKD (lab)
NefL ModL: Moderate CKD (lab)
NefL SevL: Severe CKD (lab)
Nefr ESRD: End-stage CKD
Nefr ModC: Moderate CKD
Nefr SevC: Severe CKD
Neur Neur: Neuropathy
Reti Reti: Retinopathy

```

The other source is the programming statements in the SAS-program `10-compel.sas`, where `min()` is used to define a new complication data as the earliest of a set of existing:

```

> prg <- read.table('../sas/10-compel.sas', sep='|', as.is=TRUE)[,1]
> (prg <- prg[grep('min\\(', prg)])
[1] " doIHD = min(doIHDx, doMI) ;"
[2] " doStr = min(doHStr, doIStr) ;"
[3] " doACD = min(doStr, doTCI, doIHD, doMAtd) ;"
[4] " doMajA= min(doUppA, doMedA) ;"
> vars <- gsub(' ', '',
+           gsub('= min\\(', ' ', ', ',
+           gsub(') ;', ' ', ', ',
+           gsub('do', ' ', prg)))
> (lv <- strsplit(vars, ' '))
[[1]]
[1] "IHD" "IHDx" "MI"

[[2]]
[1] "Str" "HStr" "IStr"

[[3]]
[1] "ACD" "Str" "TCI" "IHD" "MAtd"

[[4]]
[1] "MajA" "UppA" "MedA"
> pr <- function(x) cbind(x[01], x[-1])
> (xtra <- do.call(rbind, lapply(lv, pr)))
      [,1] [,2]
[1,] "IHD" "IHDx"
[2,] "IHD" "MI"

```

```

[3,] "Str"  "HStr"
[4,] "Str"  "IStr"
[5,] "ACD"  "Str"
[6,] "ACD"  "TCI"
[7,] "ACD"  "IHD"
[8,] "ACD"  "MAtd"
[9,] "MajA" "UppA"
[10,] "MajA" "MedA"
> grp <- c(grp, xtra[,1])
> diag <- c(diag, xtra[,2])
> dgr <- data.frame(grp, abn[diag])
> dgr <- dgr[!duplicated(dgr),]
> oo <- order(dgr[,1],dgr[,2])

```

Once this has been collected, can print the data frames that shows the groupings of the complications—note that this is not a hierarchical grouping, some complications occur twice on the right hand side:

```

> print(data.frame(Groups = abn[unique(dgr[,1])]),
+       right = FALSE,
+       row.names = FALSE)
Groups
Amp: Amputation
CbVD: Cerebrovascular disease
CVD: Cardiovascular Disease
DNef: Diabetic nephropathy
HpoG: Hypoglyceamia
Keto: Ketoacidosis
MAtd: Macrovascular atherosclerotic disease
NefL: Nephropathy (lab)
Nefr: Nephropathy
Neur: Neuropathy
Reti: Retinopathy
IHD: Ischeamic heart disease
Str: Stroke
ACD: Atherosclerotic cardiovascular disease
MajA: Major amputation
> print(dgr[oo,],
+       right = FALSE,
+       row.names = FALSE)
grp  abn.diag.
ACD  IHD: Ischeamic heart disease
ACD  MAtd: Macrovascular atherosclerotic disease
ACD  Str: Stroke
ACD  TCI: Transient cerebral ischaemia
Amp  MedA: Medium amputation
Amp  MinA: Minor amputation
Amp  UppA: Upper amputation
CbVD HStr: Haemmoragic stroke
CbVD IStr: Ischaemic stroke
CbVD TCI: Transient cerebral ischaemia
CVD  AFib: Atrial fibrillation
CVD  HF: Heart failure
CVD  HypD: Hypertensive disease
CVD  IHDx: non-MI Ischeamic heart disease
CVD  MI: Myocardial Infarction

```

```

DNef MacA: Macro-abuminuria
DNef MicA: Micro-abuminuria
HpoG HpoG: Hypoglyceamia
IHD IHDx: non-MI Ischeamic heart disease
IHD MI: Myocardial Infarction
Keto Keto: Ketoacidosis
MajA MedA: Medium amputation
MajA UppA: Upper amputation
MAtd MAtd: Macrovascular atherosclerotic disease
NefL ESRL: End-stage CKD (lab)
NefL ModL: Moderate CKD (lab)
NefL SevL: Severe CKD (lab)
Nefr ESRD: End-stage CKD
Nefr ModC: Moderate CKD
Nefr SevC: Severe CKD
Neur Neur: Neuropathy
Reti Reti: Retinopathy
Str HStr: Haemmoragic stroke
Str IStr: Ischaemic stroke

```

Here is a bit more elaborate print of the groupings:

```

> dd <- sapply(dgr[oo,], as.character)
> wh <- cumsum(2 - duplicated(dd[,1]) )
> xx <- dd[1,,drop=FALSE]
> xx[,1] <- '-----'
> xx[,2] <- ''
> xx <- xx[rep(1,wh[length(wh)]+1),]
> xx[wh,] <- dd

```

Complication names

In order to get the long informative names of the complications we read the `.csv` file which is the base for the generating the format used for grouping and labeling of complications. This has the long form of the complications labels:

```

> cnam <- read.csv( "../fmts/compfmt.csv", header=TRUE )
> cnam <- subset( cnam, FMTNAME=="$abb2txt" )
> compl.names <- as.character( cnam$LABEL )
> names( compl.names ) <- cnam$START
> cbind( compl.names )
      compl.names
AtCV "Atherosclerotic CVD"
MAtd "Macrovascular atherosclerotic disease"
ACD  "Atherosclerotic cardiovascular disease"
AFib "Atrial fibrillation"
HF   "Heart failure"
IHD  "Ischeamic heart disease"
IHDx "non-MI Ischeamic heart disease"
MI   "Myocardial Infarction"
HypD "Hypertensive Disease"
HpoG "Hypoglyceamia"
CbVD "Cerebrovascular disease"
Str  "Stroke"
IStr "Ischaemic stroke"
HStr "Haemmoragic stroke"

```

```
TCI "Transient cerebral ischaemia"
Keto "Ketoacidosis"
MajA "Major amputation"
UppA "Upper amputation"
MedA "Medium amputation"
MinA "Minor amputation"
Neur "Neuropathy"
Reti "Retinopathy"
ModC "Moderate CKD"
SevC "Severe CKD"
ESRD "End-stage CKD"
ModL "Moderate CKD (lab)"
SevL "Severe CKD (lab)"
ESRL "End-stage CKD (lab)"
Amp "Amputation"
CVD "Cardiovascular Disease"
Nefr "Nephropathy"
NefL "Nephropathy (lab)"
DNef "Diabetic nephropathy"
MicA "Micro-abuminuria"
MacA "Macro-abuminuria"
```

Now `compl.names` is a character vector with the long names of the complications. The `names` attribute of this vector is the abbreviations of the complications used in `fcompl` and `wcompl`; we see that they are all there:

```
> (zz <- sort(match(paste0("do", names(compl.names)), names(wcompl))))
 [1] 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29
[29] 30 31 32 33 34 35
> table(diff(zz))
 1
33
```

—if they were not, there would be NAs in the vector or the sequence would not be complete. The `table` also demonstrates that there are 33 entries in `zz`.

The point of using the abbreviations as `names` attributes of the `compl.names` is that you can get the official long text by indexing with the abbreviation:

```
> compl.names["CbVD"]
           CbVD
"Cerebrovascular disease"
```

which is useful when labeling tables and graphs.

Number of recurrent events per person

Here is an account of how many persons have how many recurrences of each of the recurrent types of complications:

```
> nn <- data.frame(N=1)
> for( nm in unique(rcompl$compl) )
+   {
+     dd <- data.frame(with(subset(rcompl, compl == nm), table(table(pnr))))
+     names(dd) <- c("N", nm)
+     dd$N <- as.numeric(as.character(dd$N))
```

```

+   nn <- merge(dd, nn, all=TRUE)
+ }
> mm <- as.matrix(nn[,-1])
> row.names(mm) <- nn$N
> rCtable( mm[1:30,] )

```

	Keto	HpoG	Str	MI
1	7,339	27,173	145,540	105,892
2	3,533	12,666	99,791	70,329
3	1,718	5,152	58,389	45,505

6	351	971	13,361	17,954
7	242	640	8,175	12,189
8	185	407	5,129	8,344
9	134	325	3,310	5,533
10	94	266	2,198	3,968
11	94	190	1,434	2,746
12	62	147	1,008	1,991
13	54	92	664	1,354
14	48	106	475	1,034
15	40	70	319	754
16	44	67	232	579
17	21	42	178	399
18	31	49	134	335
19	27	41	101	258
20	21	28	69	199
21	16	30	40	136
22	11	25	40	103
23	15	20	32	89
24	7	16	26	75
25	7	19	17	63
26	11	16	17	51
27	9	11	11	38
28	6	17	11	23
29	7	12	11	27
30	11	10	9	18

Grooming the data frames

We want to store the datasets as `data.frames`, we remove the `label` and the `format.sas` attributes of the `pnr` variable:

```

> wcompl <- plyr::rename(as.data.frame(wcompl), c("PNR"="pnr"))
> attr(wcompl$pnr, "format.sas") <- NULL
> attr(wcompl$pnr, "label") <- NULL
> attr(wcompl$doIHD, "label") <- NULL
> attr(wcompl$doStr, "label") <- NULL
> attr(wcompl$doACD, "label") <- NULL
> attr(wcompl$doMajA, "label") <- NULL
> rcompl <- as.data.frame(rcompl)
> attr(rcompl$pnr, "format.sas") <- NULL
> attr(rcompl$pnr, "label") <- NULL
> attr(rcompl$compl, "label") <- NULL

```

Finally we convert the date variables in data frames to class `cal.yr`:

```
> wcompl <- cal.yr(wcompl)
> rcompl <- cal.yr(rcompl)
```

We save these as R-datasets and document how long it takes to read them back in—note that we save the names vector with each of the files, too.

```
> save(wcompl, compl.names, file = "../data/wcompl.Rda")
> system.time( load(file = "../data/wcompl.Rda", v=T))
```

```
Loading objects:
wcompl
compl.names
bruger system forløbet
3.47 0.03 3.52
```

```
> save(rcompl, compl.names, file = "../data/rcompl.Rda")
> system.time( load(file = "../data/rcompl.Rda", v=T))
```

```
Loading objects:
rcompl
compl.names
bruger system forløbet
1.84 0.03 1.87
```

Thus these data sets provide for a reading time which is a factor 5–10 smaller than reading from the SAS files.

3.6.3 Microvascular complications

The dates for microvascular complications are a bit special. The lab-based complications `doMicA`, `doMacA`, `doModL`, `doSevL` and `doESRL` are difficult to use; only information after 2010 is available, and information for Region Midt is absent.

Moreover the lab-based micro-vascular complications are always ordered, such that `doMicA < doMacA`, the opposite inequality does not occur:

```
> with(wcompl,
+   ftable(mic = !is.na(doMicA),
+         mac = !is.na(doMacA),
+         "mic<mac" = doMicA < doMacA,
+         exclude = NULL,
+         col.vars = 1:2))
      mic FALSE      TRUE
mac   FALSE  TRUE  FALSE  TRUE
mic<mac
TRUE      0      0      0 21565
NA      1751180 23462 165297      0
```

You will note that there are occurrences of a valid value of `doMacA`, with NA for `doMicA`. So the meaning of `doMicA` is “date of microalbuminuria only”. If you want the date of “date of *at least* microalbuminuria”, you must use for example:

```
> doalMicA <- pmin(doMicA, doMacA, na.rm = TRUE)
```

This is also the case for the lab-based kidney measurements:

```

      NA    FALSE      .      .      .      .      .      .      .
      TRUE      .      .      .      .      .      .      .
      NA      .      .      .      .      .      .      3053
NA    FALSE FALSE      .      .      .      .      .      .
      TRUE      .      .      .      .      .      .      .
      NA      .      .      .      .      .      11699      .
      TRUE FALSE      .      .      .      .      .      .
      TRUE      .      .      .      .      .      .      .
      NA      .      .      .      .      .      11027      .
      NA    FALSE      .      .      .      253      .      .
      TRUE      .      .      .      .      406      .      .
      NA      1837804  28830  2525      .      62440      .      .

```

Finally note that valid dates for the microvascular complications vary considerably by calendar time:

```

> MicA <- data.frame(table(pmax(1995,floor(wcompl$doMicA)))) %>% rename(MicA = Freq)
> MacA <- data.frame(table(pmax(1995,floor(wcompl$doMacA)))) %>% rename(MacA = Freq)
> ModL <- data.frame(table(pmax(1995,floor(wcompl$doModL)))) %>% rename(ModL = Freq)
> SevL <- data.frame(table(pmax(1995,floor(wcompl$doSevL)))) %>% rename(SevL = Freq)
> ESRL <- data.frame(table(pmax(1995,floor(wcompl$doESRL)))) %>% rename(ESRL = Freq)
> ModC <- data.frame(table(pmax(1995,floor(wcompl$doModC)))) %>% rename(ModC = Freq)
> SevC <- data.frame(table(pmax(1995,floor(wcompl$doSevC)))) %>% rename(SevC = Freq)
> ESRD <- data.frame(table(pmax(1995,floor(wcompl$doESRD)))) %>% rename(ESRD = Freq)
> MicA <- mutate(MicA, Var1 = as.numeric(as.character(Var1)))
> MacA <- mutate(MacA, Var1 = as.numeric(as.character(Var1)))
> ModL <- mutate(ModL, Var1 = as.numeric(as.character(Var1)))

Note that this table is a table of persons in the entire Danish population with each of these complications, tabulated by the `first` occurrence of the complication.

3.6.4 Using the complications data sets

This is the only part of the section you need read. There are two datasets available, both with complications in the *entire* Danish population.

Essentially the SAS datasets have been read and converted to R-datasets

wcompl: One record per person with at least one complication, key is **pnr**, and with further 34 variables, namely the date of first occurrence of each of the 34 (groups of) complications. The variable with data of complication **XXX** is **doXXX**

rcmpl: One record per person and recurrent complication (**HpoG**, **Keto**, **MI**, **Str**); the key is (**pnr**, **compl**, **doC**—date of complication), and there are no other variables in the dataset.

When loading each of the datasets you do not only get the complications datasets, but also the human readable labels of each of the variables in `compl.names`.

```
> system.time(load(file = "../data/wcompl.Rda", v=T))
Loading objects:
  wcompl
  compl.names
  bruger    system forløbet
    3.35     0.08     3.43

> names(wcompl)

 [1] "pnr"      "doESRD" "doHypD" "doMI"    "doMedA" "doMinA" "doReti" "doTCI"  "doUppA"
[10] "doAFib"  "doIHDx" "doIStr" "doMicA"  "doModL" "doMAtd" "doModC" "doHF"   "doHpoG"
[19] "doHStr"  "doSevL" "doNeur" "doMacA"  "doKeto" "doESRL" "doSevC" "doAmp"  "doCVD"
[28] "doCbVD"  "doNefr" "doDNef" "doNefL"  "doIHD"  "doStr"  "doACD"  "doMajA"

> system.time(load(file = "../data/rcmpl.Rda", v=T))
Loading objects:
  rcmpl
  compl.names
  bruger    system forløbet
    1.84     0.00     1.84

> names(rcmpl)

 [1] "pnr"      "compl"  "doC"
```

The vector `compl.names` is a *named* character vector, the names are the abbreviations, they can be used as indices, e.g.:

```
> compl.names['CVD']
          CVD
"Cardiovascular Disease"
```

The grouping of complications are as follows; note that some groups appear both sides, and some appear more than once on the RHS—it is not a strict hierarchical grouping:

```
> print(as.data.frame(xx),
+       row.names = FALSE,
+       col.names = FALSE,
+       right = FALSE)
```

```

```

The basic hierarchical grouping of all ICD-10-codes is in the output file
v:\sdc\469drive\DMreg2020\sas\10-compl.lst

Code: E:/workdata/707655/DMreg2020/r/mkCompl.rnw

```
Ends: 2022-01-26 at 13:30:36
Time elapsed:      00:01:56
```

3.7 The RMPS database

```
> library( Epi )
> library( tidyverse )
> library( haven )
> setwd("E:/workdata/707655/DMreg2020/r")
> clear()
> source("E:/workdata/707655/util/elapsed.r")
> start()
```

```
Code: E:/workdata/707655/DMreg2020/r/mkRMPS.rnw
Time: 2022-01-25 at 17:02:02
```

The RMPS (prescription register) is very large, each year some 30 mil. records, so it is a tall order to read this by R, so we read it by SAS and created a number of SAS-files, each with a subgroup of drugs, see 00-rmps. These are then read in turn by R and saved in R-format.

3.7.1 The ATC codes with names

We extract the ATC codes and corresponding names from the DST format file and saved it as a character vector with a names attribute equal to the ATC codes:

```
> atcnam <- read_sas( paste0("../data/rmps/atcnam.sas7bdat") )
> names(atcnam) <- tolower(names(atcnam))
> atclab <- atcnam$label
> names(atclab) <- atcnam$start
> cbind(atclab[1:10])
      [,1]
A      "A Fordøjelsesorganer og stofskifte"
A01    "A01 midler mod sygdomme i mundhulen"
A01A   "A01A stomatologica"
A01AA  "A01AA midler mod caries"
A01AA01 "A01AA01 natriumfluorid"
A01AA02 "A01AA02 natriummonofluorophosphat"
A01AA03 "A01AA03 olaflur"
A01AA04 "A01AA04 stannofluorid"
A01AA30 "A01AA30 kombinationer"
A01AA51 "A01AA51 natriumfluorid, komb."
```

This means that we can subset the `atclab` by ATC-codes to mimic the format machinery of SAS.

3.7.2 Converting to .Rda

The SAS program 00-labka contains the names and the labels of the files, so we read the SAS-code and extract the file names and the labels for use in the R-files:

```
> whf <- shell("dir ..\\data\\rmps", intern=TRUE)
> whf <- gsub(".sas7bdat", "",
+           fgrep("s7b",
+               unlist(strsplit(fgrep('s7b', whf), " "))))
> (whf <- whf[whf != "atcnam"])
[1] "ins"   "oad"   "plate" "card"  "blpr"  "renal" "lipid"
```

We now have the filenames (without extension) — note all filenames are in lower case.

Then we read the SAS-files, coerce them to `data.frames`, strip the disturbing attributes of the variables, convert the dispense date to `cal.yr`, assigns the proper label to the `label` attribute of the data frame. It is then assigned to a object with the proper name and subsequently saved in an R-file with the same name. For convenience the `atcnam` is saved in the same file too.

```
> for( fn in whf )
+ {
+   cat( "\n-----\n",
+       fn, " start at", format( Sys.time(), "%T" ) )
+   system.time(
+   xx <- read_sas( paste0("../data/rmps/", fn, ".sas7bdat") ) )
+   names(xx) <- tolower(names(xx))
+   xx <- cal.yr(as.data.frame(xx))
+   for( i in names(xx)) attr( xx[,i], "format.sas" ) <- NULL
+   for( i in names(xx)) attr( xx[,i], "label" ) <- NULL
+   xx <- mutate(xx, doso = factor(doso),
+               atc = factor(atc))
+   attr(xx, "label") <- fn
+   assign( fn, xx )
+   system.time(
+   save( list = c(fn, 'atclab'),
+       file = paste0("e:/workdata/707655/DMreg2020/data/rmps/", fn, ".Rda" ) ) )
+   cat(" , ended at", format(Sys.time(), "%T"), '---',
+       fn, "has", fCp(nrow(xx)), "rows.\n" )
+   tt <- table(xx$atc)
+   names(tt) <- atclab[names(tt)]
+   print(fCp(cbind(tt), w=15))
+   rm(list = fn)
+ }
```

```

3.7.3 Retrieving the data for each ATC group

Thus, for example if you need the lipid lowering drugs you just do:

```
> system.time(load("e:/workdata/707655/DMreg/data/rmps/lipid.Rda", v = T))
```

Loading objects:

```
lipid
atclab
bruger    system forløbet
26.99    0.29    27.44
```

```
> str(lipid, v = 0)
```

```
'data.frame':      36224144 obs. of  8 variables:
 $ pnr      : chr    ...
 $ eksd     : 'cal.yr' num  NULL ...
 $ apk      : num  NULL ...
 $ doso     : Factor w/ 221 levels "", "0000000", "0000001", ...: NULL ...
 $ atc      : Factor w/ 20 levels "C10AB01", "C10AB02", ...: NULL ...
 $ strnum   : num  NULL ...
 $ strunit  : chr    ...
```

```

$ packsize: num NULL ...
- attr(*, "label")= chr ...
> attr(lipid, "label")
[1] "lipid"
> fCp(object.size(lipid))
[1] 2,105,797,376

```

The last use of `attr` is necessary because `v=0` also cuts the the first (and only) element of the `label` attribute, so if you want a human readable label this is what to do.

```

-----
Code: E:/workdata/707655/DMreg2020/r/mkRMPS.rnw
Ends: 2022-01-25 at 18:02:42
Time elapsed:      01:00:40
-----

```

3.8 The LABKA database

```

> library(Epi)
> library(tidyverse)
> library(haven)
> folder <- "E:/workdata/707655/DMreg2020/data/"
>   setwd("E:/workdata/707655/DMreg2020/r")
>   source("E:/workdata/707655/util/elapsed.r")
> start()

```

```

-----
Code: E:/workdata/707655/DMreg2020/r/mkLABKA.rnw
Time: 2022-01-31 at 19:57:28
-----

```

LABKA measurements are in a very large file, approx. 350 mil. records, so we have read the file and created 26 sas-files each with a separate type of measurement in the folder:
E:\workdata\707655\DMreg2020\data\labka.

3.8.1 SAS splitting of the LABKA data.

3.8.2 Converting to .Rda

The SAS program 00-labka contains the names and the labels of the files, so we read the SAS-code and extract the file names and the labels for use in R:

```

> ll <- read.table("../sas/00-labka.log", sep="/")[,1]
> ll <- grep("label", ll, value = TRUE)
> dot <- sapply(strsplit(ll, ""), function(x) which(x == "."))
> eql <- sapply(strsplit(ll, ""), function(x) which(x == "="))
> rbr <- sapply(strsplit(ll, ""), function(x) which(x == "))")
> nam <- gsub(" ", "", substr(ll, dot+1, dot+4))
> lab <-      substr(ll, eql+2, rbr-2)
> nam <- tolower(nam)
> names(lab) <- nam
> cbind(lab)

```

```

lab
hba1 "Hba1c"
gluc "Glukose"
glu0 "Glukose 0"
gl30 "Glukose 30"
gl120 "Glukose 120"
tchl "Total kolesterol"
ldl "LDL kolesterol"
hdl "HDL kolesterol"
vldl "VLDL kolesterol"
trig "Triglycerid"
plcr "Plasma Kreatinin"
uacr "Ualbcrea"
pota "Kalium"
sodi "Natrium"
tsh "TSH"
cpep "C-peptid/Proinsulin"
crp "CRP"
gad "GAD65"
egfr "eGFR"
gfr "GFR"
alat "ALAT"
alcp "Basisk fosfatase"
cobl "Cobalamin"
trmb "Trombocytter"
leuc "Leucocytter"
hmgb "Hæmoglobin"

```

We now have the filenames (without extension) — note all filenames are in lower case; they are in the `names` attribute of the `lab` vector of labels of the various types of measurements.

Then we read the SAS-files, coerce them to `data.frames`, strip the disturbing attributes of the variables, assigns the proper label to the `label` attribute of the data frame, and convert the date variable to `cal.yr`. It is then assigned to a object with the proper name and subsequently saved in an R-file with the correct name.

```

> for (fn in names(lab))
+ {
+   cat(substr(paste0(fn, " "), 1, 4),
+       "start at", format(Sys.time(), "%T"))
+   xx <- read_sas(paste0(folder, "labka/", fn, ".sas7bdat"))
+   xx <- as.data.frame(xx)
+   for (i in names(xx)) attr(xx[,i], "format.sas") <- NULL
+   attr(xx$SAMPLINGTIME, "units") <- NULL
+   attr(xx, "label") <- lab[fn]
+   xx <- cal.yr(xx)
+   xx$numval <- as.numeric(gsub(",", ".", xx$VALUE))
+   assign(fn, xx)
+   save(list = fn,
+       file = paste0(folder, "labka/", fn, ".Rda"))
+   cat(" end at", format(Sys.time(), "%T"),
+       "Nrow =", paste(fCp(nrow(xx), w = 10), "\n"))
+   rm(list = fn)
+ }
hba1 start at 19:57:28 end at 20:00:01 Nrow = 11,944,532
gluc start at 20:00:01 end at 20:01:50 Nrow = 8,299,695
glu0 start at 20:01:50 end at 20:02:00 Nrow = 755,395

```

```

gl30 start at 20:02:00 end at 20:02:01 Nrow =    10,117

plcr start at 20:11:53 end at 20:18:29 Nrow = 31,203,065
uacr start at 20:18:29 end at 20:18:59 Nrow =  2,468,127
pota start at 20:18:59 end at 20:24:45 Nrow = 29,228,335
sodi start at 20:24:45 end at 20:30:39 Nrow = 29,211,285
tsh start at 20:30:39 end at 20:33:22 Nrow = 12,638,509
cpep start at 20:33:22 end at 20:33:24 Nrow =   175,615
crp start at 20:33:24 end at 20:37:21 Nrow = 19,725,052
gad start at 20:37:21 end at 20:37:22 Nrow =    34,598
egfr start at 20:37:22 end at 20:43:03 Nrow = 28,886,389
gfr start at 20:43:03 end at 20:43:03 Nrow =    1,991
alat start at 20:43:03 end at 20:47:21 Nrow = 21,494,445
alcp start at 20:47:21 end at 20:50:35 Nrow = 15,829,034
cobl start at 20:50:35 end at 20:51:57 Nrow =  5,914,858
trmb start at 20:51:57 end at 20:56:22 Nrow = 20,616,979
leuc start at 20:56:22 end at 21:01:35 Nrow = 24,539,594
hmgb start at 21:01:35 end at 21:07:37 Nrow = 29,581,634

```

Thus, for example if you need the cobalamin measurements you just do:

```

> system.time(load("e:/workdata/707655/DMreg2020/data/labka/cobl.Rda",
+                 v = T))
Loading objects:
  cobl
  bruger  system forløbet
    9.71    0.11    10.84
> str(cobl, v = 0)
'data.frame':    5914858 obs. of  8 variables:
 $ pnr          : chr   ...
 $ SAMPLINGDATE : 'cal.yr' num  NULL ...
 $ SAMPLINGTIME : 'hms' num   ...

Time elapsed:      01:10:23  
-----
```

Chapter 4

SAS programs

4.1 Rationale and overview

The following documented programs sequentially construct data sets with dates of diagnosis of DM according to different criteria, then merge these to pick the earliest. All computing is done at the server of Statistics Denmark.

All created data will be in the data folder as SAS-datasets, and the SAS log and `lst` files will be printed here verbatim for documentation (the latter after removal of numbers less than 4).

We have the following programs (also described in more detail in connection with the listing of the output):

`00-fmts` creates a number of useful formats used for annotation and grouping of diagnoses etc. They are in the format file `DMfmt.DMreg` (see `optslibs.sas`)

`00-base` creates:

1. `DMdat.pop` with demographic information about the entire population (sex, date of birth); key: `(pnr)`
2. `DMdat.xDK` with IM-migration and E-migration records for persons with at least one IM or Emigration (so not for from the entire population). In the file, `doEm < doIm`, so in principle each record represents a period OUT of the country (hence the `x`); key: `(pnr, doIm)`.

`00d-base` creates `DMdat.CoD` with cause of death for the population that died between 1996-1-1 and 2017-12-31. Not all deaths are in this file, only those with a cause; key: `(pnr)`

`00y-base` creates `DMdat.popreg` with information for all persons at 1 Jan each year: kommune and region of residence, highest attained educational level and family income. The classification variables may be missing for some persons. key: `(pnr, yr)`.

`01-npr` Uses the national patient register (NPR) to generate three data sets, all with `pnr` as key:

- a dataset `npr` with the two earliest dates of DM diagnosis in the NPR, `doNPR` and `doNPR2`, as well as a variable `nprtyp` with values T1 (ICD10: E10) or T2 (ICD10:

E11) or Tx (E12, E13 and E14), based on the diagnosis recorded on the last of the person's NPR entries.

Thus formally some of the follow-up will be based on type-information from future recordings—*i.e.* records later than doNPR; key: (pnr)

- a dataset pcos with the earliest date of registered PCOS, doPCOS; key: (pnr)
- a dataset gdm with recorded dates of GDM that are at least 200 days apart, doGDM1, doGDM2, ...; key: (pnr)

02-dvdd Uses the DVDD to identify persons from outpatient clinics (and in due course from GPs) and to seek out persons deemed to be T1D patients. It creates a dataset, DMdat.DVDD with key pnr and a variable for type of diabetes dvdtyp, based on whether T1, T2 or other is recorded on the person's last record in DVDD. Thus formally some of the follow-up will be based on type-information from a future recording. The variable dvdtyp has missing values; key: (pnr)

03-nhsr Uses the NHSR to get the date of the first podiatry (foot-therapy) service for diabetes patients and excludes records with examination date in the GDM grace interval. Creates the dataset DMdat.foot with the date variable doPod; key: (pnr)

04-rmps Generates a dataset DMdat.pRMPS with one record per person, with dates of first and second purchase of OAD (doOAD, doOAD2) resp. insulin (doIns, doIns2); key: (pnr).

05-diab Extracts data from the DiaBase, excludes records with examination date in the GDM grace interval, and selects the earliest record for each person and defines the date in the variable DMdat.doDiaB.

05-hba1 Extracts data from DVDD and the LABKA file of HbA_{1c} measurements, and selects persons with two consecutive HbA_{1c} measurements of 48 mmol/mol or more. The date of meeting the criterion is the date of the last of the two consecutive measurements over the limit.

06-define Collects data from the 6 previously created data sets and defines date of diagnosis and type of diabetes (T1/T2/Tx), and thus generates a DM-register with sex, date of birth, date of death, date of inclusion (“diagnosis”).

However, some 67% dates of diagnosis in the DVDD are either 1st January or 15th June; both of which we interpret as “sometime during the year”. The consequence of this that if a person meets any other criterion, the diagnosis date from DVDD will be ignored and the person will be included at the date of the other criterion. In short, the date from DVDD will only be used if no other criterion is met.

For persons with a record from DVDD with type of diabetes defined, this is used. If different types are given in different records, the most frequent type is used, but only if present in more than half of the records. If a person is not classified from DVDD, the classification from NPR is used.

Further, a person is classified as T1 if insulin has been taken out before age 30 (unless classified as T2 or Tx in DVDD, but regardless of the NPR classification).

Finally, a person cannot be classified as T1 if no insulin purchase is recorded.

- 10-**labcomp1** Extracts clinical measurements from LABKA and DVDD and defines dates of severe, moderate and end stage kidney disease, as well as dates of micro- and macro-ablunimuria. This is done for the *entire* Danish population.
- 10-**comp1** Defines complication dates based on NPR-records and appends the lab-defined complications from 10-**labcomp1**. This is done for the *entire* population.
- 00-**labka** Reads the (very large) file of LABKA-measurements and subdivides it into 26 smaller files with one type of lab-measuremenmt in each.
- 00-**rmpps** Reads the (very large) file of drug dispenstions and subdivides it into 7 smaller files with one group of drugs in each.

4.2 Program execution

All data analyses are run on the servers at Statistics Denmark. In order to have a thorough documentation of the data processing all SAS-programs have been run in sequence as batch jobs from the command prompt (`cmd`), where the program in the file `xxx.sas`, say, is run and produces the files `xxx.log` and `xxx.lst`. Since the code from `xxx.sas` is contained in `xxx.log`, it suffices to show the files `xxx.log` and `xxx.lst` to provide full documentation of the data acquisition process.

The practical execution of the SAS-programs is done using the `cmd`-script `sj.bat` which reads:

```
start "sas job" /min sjx %~n1
```

The running of the program `xxx.sas` is started by issuing “`sj xxx`” at the command prompt.

The script `sj.bat` just starts a new process which in turn runs the script `sjx.bat`, which reads:

```
"C:\Program Files\SASHome\SASFoundation\9.4\sas.exe" ^
-CONFIG "C:\Program Files\SASHome\SASFoundation\9.4\nls\en\sasv9.cfg" ^
-$lognotel "Program: %~n1.sas" -nonews -linesize 90 ^
-autoexec optslibs.sas -sysin %~n1.sas
copy %~n1.log + %~n1.lst %~n1.yt
rem del %~n1.log
rem del %~n1.lst
exit
```

The second last line in the script simply copies the two result-files from SAS into one for convenience of inspection. It is the two resulting files `.log` and `.log` that are transferred from DST to a local computer for inclusion in a documentation report (after removal of too small table entries). Thus the `.lst` files on the served have been edited to meet the criteria for transfer out of DST. But the original contents of the `.lst` is part of the `.yt` file so it can be retrieved—but only on DST/FSE.

Note that the script (`sjx.bat`) runs SAS with `-autoexec=optslibs.sas`, so effectively all programs are preceded by execution of `optslibs.sas`. The file `optslibs` contains definitions of libraries and a couple of macro constants used throughout the programs.

This way there is a reasonable documentation that the results are actually produced by the listed code (in the `.log` file). Hopefully the code in the SAS-programs is reasonably human-readable, too.

4.3 Program documentation

The following is a listing of the SAS-programs and -results (that is the .log and .lst files) used to generate the base data sets. Each one is preceded by a brief description; the main technical points are included as comments in the program code, found in the .log files.

Note that according to rules of DST, all table entries of 3 or less in .lst file are masked as a “*”. This is done in an automated process, so also occurrences of 1, 2 and 3 not strictly necessary to mask have been masked.

4.3.1 optslibs.sas

This is common set of declarative commands that defines a couple of options, the location of the raw and the derived data sets and some global macro variables used for handling GDM and PCOS and definition of T1D. It is included as autoexec file in all runs, note the `options nonotes` for brevity of output:

```
* options used throughout ;
options nocenter nonotes nomprint nosource2
      ps = 10000 /* 105 */
      ls = 90    /* 160 */
      obs = max
      formchar = ' - '
      nofmterr /* dont crash with missing formats */
/* format libraries we use */
fmtsearch = ( dsfmt.times_personstatistik
              dsfmt.brancher
              dsfmt.uddannelser
              dsfmt.disced
              dsfmt.geokoder
              dsfmt.sundhed
              dsfmt.statistikbank
              DMfmt.DMreg ) ;

* data libraries ;
libname grund 'E:\rawdata\707655\Grunddata\' ;

4.3.2 xgdm.sas

Note that the file `optslibs.sas` also contains the definition of the `xgdm` macro: For each of the criteria it is necessary to exclude dates of meeting the criterion which fall within a grace period after a diagnosis of GDM. This is what the macro `xgdm` is for; it relies on the structure of the GDM dataset constructed in the `01-npr` program, which has the GDM dates in the wide form for person with at least one date of GDM. It iterates up to 12 in order to produce a note from the SAS system, that documents that only 11 GDM dates were needed.

4.4 00-base

Reads the files with all person ids (`pnr`), for each calendar year of data, and forms a total roster of all `pnr` with demographic information (sex, date of birth, date of death).

Also reads all migration records, and forms a dataset of time spent *outside* of Denmark, which is used by the program `08-mkFU` to count only events and person-years among persons actually present in Denmark.

4.5 00d-base

Reads the cause of death register files and classifies deaths by cause in four categories: CVD, Cancer, Respiratory and Other. Also defines a 10-level categorization of causes of death.

DQ332	Sequestrum pulmonum	*
DQ334	Medfødt bronkiektasi	*
DQ335	Ektopisk væv i lunge	*
DQ338	Anden medfødt lungemisdannelse	4
DQ340	Medfødt misdannelse af lungehinde	8
DQ341	Medfødt mediastinal cyste	*
DQ375	Enkeltsidig løbe-gumme-ganespalte	*
DQ390	Øsofagusatresi uden fistel	4
DQ391	Øsofagusatresi med medfødt trakeoøsofageal fistel	*
DQ392	Medfødt trakeoøsofageal fistel uden øsofagusatresi	*
DQ393	Medfødt stenose eller striktur i øsofagus	*
DQ396	Øsofagusdivertikel	4
DQ398	Anden medfødt misdannelse i øsofagus	*
DQ401	Medfødt hiatushernie	*
DQ408	Anden medfødt misdannelse i øvre fordøjelsesorganer	*
DQ410	Agenesi, atresi eller medfødt stenose af duodenum	*
DQ412	Agenesi, atresi eller medfødt stenose af ileum	*
DQ418	Agenesi, atresi el. medfødt stenose af anden del af tyndtarm	*
DQ419	Agenesi, atresi eller medfødt stenose af tyndtarm UNS	*
DQ422	Agenesi, atresi eller medfødt stenose af anus med fistel	*
DQ429	Agenesi, atresi eller medfødt stenose af tyktarm UNS	*
DQ430	Meckels divertikel	12
DQ431	Medfødt megacolon	5
DQ432	Anden medfødt forstyrrelse i tyktarmens funktion	*
DQ433	Medfødt misdannelse i mesenterie, oment eller peritoneum	*
DQ438	Anden medfødt misdannelse i tarmkanalen	4
DQ442	Atresi af galdegang	25
DQ445	Anden medfødt misdannelse i galdegang	*
DQ446	Medfødt cystelever	9
DQ447	Anden medfødt misdannelse i lever	*
DQ450	Agenesi, aplasi og hypoplasi af pancreas	*
DQ451	Pancreas annulare	*

DQ452	Medfødt pancreascyste	*
DQ453	Anden medfødt misdannelse af pancreas el. ductus pancreatis	*
DQ459	Medfødt misdannelse i fordøjelsessystem UNS	*
DQ600	Enkeltsidig nyreagenesi	7
DQ601	Dobbeltsidig nyreagenesi	*
DQ602	Nyreagenesi UNS	*
DQ604	Dobbeltsidig nyrehypoplasi	*
DQ610	Medfødt nyrecyste	8
DQ611	Polycystisk nyresygdom med autosomal recessiv arvegang	*
DQ612	Polycystisk nyresygdom med autosomal dominant arvegang	92
DQ613	Polycystisk nyresygdom UNS	211
DQ614	Cystisk renal dysplasi	*
DQ615	Medullær svampenyre	12
DQ618	Anden form for cystenyre	5
DQ619	Cystenyre UNS	24
DQ620	Medfødt hydronefrose	*
DQ621	Medfødt atresi eller stenose af urinleder	*
DQ622	Medfødt dilatation af urinleder	*
DQ628	Anden medfødt misdannelse i urinleder	*
DQ631	Lobuleret nyre, kagenyre eller hesteskonyre	*
DQ638	Anden medfødt nyremisdannelse	7
DQ639	Medfødt misdannelse i nyre UNS	4
DQ647	Anden medfødt misdannelse af urinblære og urinrør	*
DQ648	Anden medfødt misdannelse i urinveje	*
DQ649	Medfødt misdannelse i urinveje UNS	4
DQ652	Medfødt hofteleksation UNS	*
DQ675	Medfødt deformitet af rygsøjle	9
DQ688	Anden medfødt misdannelse i muskel eller knogle	*
DQ743	Arthrogryposis multiplex congenita	*
DQ751	Kraniofacial dysostose	*
DQ752	Hypertelorisme	*
DQ753	Makrocefali	*
DQ754	Mandibulofacial dysostose	*
DQ763	Medfødt skoliose forårsaget af knoglemisdannelse	7
DQ764	Anden medfødt misdannelse af rygsøjle uden samtidig skoliose	*
DQ769	Medfødt misdannelse i brystkassens knogler UNS	*
DQ773	Chondrodysplasia punctata	*
DQ774	Akondroplasi	*
DQ780	Osteogenesis imperfecta	12
DQ782	Osteopetrose	6
DQ788	Anden form for osteokondrodysplasi	*
DQ789	Osteokondrodysplasi UNS	4
DQ790	Medfødt diafragmahernie	4
DQ791	Anden medfødt misdannelse af diafragma	*
DQ792	Omfaloccele	*
DQ793	Gastrokise	*
DQ795	Anden medfødt misdannelse af bugvæg	*
DQ796	Ehlers-Danlos´ syndrom	12
DQ799	Medfødt misdannelse i muskel eller knogle UNS	*
DQ809	Medfødt iktyosis UNS	*
DQ819	Epidermolysis bullosa UNS	*
DQ820	Arveligt lymfødem	*
DQ822	Mastocytose	*
DQ828	Anden medfødt misdannelse af huden	*
DQ829	Medfødt misdannelse af huden UNS	*
DQ850	Ikke-malign neurofibromatose	51
DQ851	Tuberøs sklerose	10
DQ858	Anden fakomatose IKA	16
DQ860	Føtalt alkoholsyndrom	*
DQ870	Syndromer med medfødte misdannelser overvejende i ansigtet	6
DQ871	Medfødt misdannelsessyndrom med dværgvækst	20
DQ872	Syndrom m. medfødt misdannelser overvejende i ekstremiteter	4
DQ873	Syndromer med medfødte misdannelser med tidlig højdevækst	*
DQ874	Marfans syndrom	54
DQ875	Andet medfødt misdannelsessyndrom med an. skeletforandringer	*
DQ878	Andet medfødt misdannelsessyndrom IKA	41
DQ890	Medfødt misdannelse i milten	*
DQ893	Situs inversus	4
DQ897	Multiple medfødte misdannelser IKA	6
DQ898	Anden medfødt misdannelse	8

DQ899	Medfødt misdannelse UNS	54
DQ900	Trisomi 21, meiotisk nondisjunktion	14

DN324	Ikke-traumatisk urinblæreruptur	12
DN328	Anden sygdom i urinblæren	24
DN329	Sygdom i urinblæren UNS	26
DN340	Uretralabsces	*
DN342	Anden form for uretritis	*
DN351	Postinfektions uretrastriktur IKA	*
DN359	Uretrastriktur UNS	27
DN360	Uretrafistel	*
DN361	Uretradivertikel	*
DN368	Anden sygdom i uretra	*
DN369	Sygdom i uretra UNS	*
DN390	Urinvejsinfektion uden angivelse af lokalisation	4,704
DN391	Vedvarende proteinuri UNS	*
DN393	Stressinkontinens	*
DN394	Anden form for urininkontinens	*
DN398	Anden sygdom i urinvejene	29
DN399	Sygdom i urinvejene UNS	40
DN40	Forstørret blærehalskirtel	156
DN409	Prostatahypertrofi	786
DN410	Akut prostatitis	*
DN411	Kronisk prostatitis	*
DN412	Prostataabsces	5
DN419	Prostatitis UNS	*
DN420	Prostatasten	*
DN421	Prostatablødning	*
DN422	Prostata-atrofi	*
DN423	Dysplasi i prostata	4
DN428	Anden sygdom i prostata	22
DN429	Sygdom i prostata UNS	24
DN433	Hydrocele UNS	7
DN450	Orkitis, epididymitis eller epididymoorkitis med absces	13
DN459	Orkitis, epididymitis eller epididymoorkitis uden absces	15
DN47	Sygdomme i forhuden	*
DN479	Sygdomme i forhuden UNS	*
DN482	Anden betændelsestilstand i penis	*
DN484	Organisk impotens	*
DN488	Anden sygdom i penis	*
DN492	Betændelsestilstand i scrotum	34

DN498	Betændelsestilstand i anden del af de mandlige kønsorganer	14
DN499	Betændelsestilstand i de mandlige kønsorganer UNS	9
DN501	Vaskulær sygdom i de mandlige kønsorganer	*
DN509	Sygdom i de mandlige kønsorganer UNS	*
DN61	Ikke-puerperal betændelse i brystkirtel	*
DN619	Ikke-puerperal betændelse i mamma UNS	*
DN629	Mammahypertrofi	*
DN63	Knude i bryst UNS	*
DN639	Mammatumor UNS	22
DN645	Andet symptom eller fund i mamma	*
DN649	Sygdom i mamma UNS	*
DN700	Akut salpingitis eller ooforitis	*
DN701	Kronisk salpingitis eller ooforitis	*
DN709	Salpingitis eller ooforitis UNS	6
DN710	Akut endometritis	8
DN711	Kronisk endometritis	*
DN719	Endometritis UNS	19
DN732	Parametritis eller flegmone i det kvindelige bækken UNS	*
DN735	Kvindelig pelveoperitonitis UNS	8
DN736	Adhærencer i det kvindelige bækken	*
DN738	Anden infektion i det kvindelige bækken	5
DN739	Infektion i det kvindelige bækken UNS	12
DN751	Absces i Bartholins kirtel	*
DN758	Anden sygdom i Bartholins kirtler	*
DN760	Akut vaginitis	4
DN764	Absces i vulva	8
DN768	Anden betændelsessygdom i vagina eller vulva	*
DN804	Endometriose i septum rectovaginalis eller vagina	*
DN809	Endometriose UNS	*
DN811	Cystocele hos kvinde	5
DN812	Livmoderprolaps uden vaginalprolaps	*
DN813	Inkomplet uterovaginal prolaps	*
DN814	Komplet uterovaginal prolaps	5
DN815	Uterovaginal prolaps UNS	6
DN816	Vaginalt enterocele	*
DN817	Rektocele	*
DN818	Anden form for kvindelig genitalprolaps	*
DN819	Kvindelig genitalprolaps UNS	4
DN820	Vesikovaginal fistel	*
DN821	Anden fistel mellem urinveje og kvindelige kønsorganer	*
DN822	Intestinovaginal fistel	6
DN823	Kolovaginal fistel	27
DN824	Anden fistel mellem kvindelige kønsorganer og tarm	5
DN831	Corpus luteum-cyste	*
DN832	Anden eller ikke specificeret ovariecyste	38
DN835	Torsion af ovarie, æggeleder eller uterine adnekser	*
DN839	Ikke-inflammatorisk sygd i ovarie, æggeleder, parametrie UNS	*
DN840	Polyp i corpus uteri	*
DN841	Polyp i livmoderhalsen	*
DN849	Polyp i kvindelige kønsorganer UNS	*
DN850	Endometriehyperplasi uden atypi	*
DN851	Adenomatøs endometriehyperplasi	*
DN852	Uterushypertrofi	*
DN858	Anden ikke-inflammatorisk sygdom i livmoderen	*
DN859	Ikke-inflammatorisk sygdom i livmoderen UNS	7
DN872	Svær dysplasi på livmoderhalsen	*
DN879	Dysplasi på livmoderhalsen UNS	*
DN893	Dysplasi i vagina UNS	*
DN898	Anden ikke-inflammatorisk sygdom i vagina	*
DN899	Ikke-inflammatorisk sygdom i vagina UNS	*
DN912	Amenoré UNS	*
DN921	Metroragi	*
DN938	Anden form for abnorm blødning fra livmoderen eller vagina	*
DN939	Abnorm blødning fra livmoderen eller vagina UNS	23
DN950	Postmenopausal metroragi	*

4.6 00y-base

Reads the files with person information and creates a dataset classified by `pnr` and year (`yr`) 1996–2019, additionally holding variables for municipality (`kom`) and region (`reg`) of residence, level of education (`udd`, `udddk` and `eduen`) and family income (`find`), as of 1 January.

4.7 01-npr

Processes the records from the NPR, and produces records with GDM diagnoses and PCOS diagnoses.

Persons cannot enter on any criterion in a 365 days grace period after each GDM diagnosis. GDM diagnoses occurring within 200 days of another one is not counted, though. Thus all GDM diagnoses in the same person are at least 200 days apart.

Outputs the earliest NPR diagnosis clear of GDM and PCOS, and derives a tentative T1 / T2 classification in the variable `nprtyp` based on the ICD10 codes for action diagnoses.

4.8 02-dvdd

The DVDD contains annual records for diabetes patients, mostly from out-patient clinics, but (eventually, but not yet) also from GPs. There records contain type and date of diagnosis. The program chooses the earliest reported date of diagnosis and the classification as T1 or T2 if reported more than half of the times (`dvdtyp`). This may be missing if neither occur in more than half of the records for a given person.

Uses the GDM dates to exclude possible inclusion dates in GDM grace periods.

4.10 04-rmps

Processes the records from the RMPS with other target medications and creates a file (pRMPS) with one record per person with at least one prescription of either OAD or insulin. Computes the first and second date of OAD, respectively insulin purchase.

Uses the GDM dates to exclude possible inclusion dates in GDM grace periods.

4.11 05-diab

Uses eye-screening dates from the national eye-screening database to supplement persons with diabetes and update dates of diabetes diagnosis.

Uses the dataset with GDM dates to exclude examination dates in GDM grace periods.

Variables in Creation Order

#	Variable	Type	Len	Format	Informat	Label
1	pnr	Char	12	\$12.	\$10.	Personnummer
2	doDia	Num	8	DDMMYY10.	IS8601DA10.	First EyeScreen date
3	lastDia	Num	8	DDMMYY10.	IS8601DA10.	Last EyeScreen date

4.12 05-hba1c

Uses data from DVDD and LABKA to establish two consecutive HbA_{1c} measurements of 48 or more.

Uses the dataset with GDM dates to exclude dates in GDM grace periods.

```

5	lastHbA	Num	8			Date of last HbA1c

4.13 06-define

Collects records from the processed registers and defines a diabetes register and the relevant dates in it.

The inclusion date will be the smaller of the earliest dates from the data sets NPR, RMPS, DVDD, NHR and DIAB, and the inclusion criterion will be the one that triggered the inclusion.

Persons are only included in the register at the second of the dates from NPR and RMPS, and the corresponding inclusion criterion is therefore one of 9 possible

Diabetes type is derived as described above.

Also derives a diabetes register exclusively based on drug information only.

4.14 06d-define

Defines the diabetes *drug-register*, i.e. the register exclusively based on drug purchases. Persons are included on the 2nd purchase of drugs, while type of diabetes is taken from DMreg.

```

4.15 10-labcomp

Reads the files of urine albumin/creatinine from LABKA and the albumin/creatinine ratio from DVDD and the GFR from the LABKA data base and plasma creatinine measurements from the DVDD. Measurements and dates of measurement are then combined to dates of severe, moderate and end stage kidney disease and to dates of micro- and macroalbuminuria in the file DMdat.micompl.

4.16 10-compl

Reads ICD10-codes from NPR for the period 1994–2018 and classifies these as belonging in 18 mutually exclusive groups of complications. The complications defined in 10-labcomp are appended. Some of the complication groups are combined in super-groups, and a total 26 different groups are formed.

4.17 00-labka

Reads the LABKA file lab_forsker and splits it in different files according to the values of the analysiscode after formatting by \$npue. The purpose is mainly to make it easier to access the LABKA measurements without necessarily reading the entire file.

4.18 00-rmps

Reads the files with prescription data (Register of Medicinal Products Statistics, LægeMiddelstatistikDataBasen) LMDByyyy and LMDByyyy_BRUTTO and saves (some of the) records in different files according to ATC-codes. The purpose is mainly to make it easier to access the RMPS measurements without necessarily reading the entire file.
